

FLORAE MALESIANAE PRECURSORES XXXVII
MATERIALS TOWARDS THE KNOWLEDGE OF THE
EPACRIDACEAE MAINLY IN ASIA, MALAYSIA, AND THE PACIFIC

H. SLEUMER
Rijksherbarium, Leyden

In the present work details are given in the first place for the extra-Australian *Epacridaceae* except *Lebetanthus* (South America), of which a part forms the base for my revision of the family for the 'Flora Malesiana' and for 'Pacific Plant Areas'. Key to the subgenera and sections of the genus *Styphelia*, to the Malaysian species of *Styphelia*, to all species of *Styphelia* subgen. *Cyathodes*, and to the species of the genus *Trochocarpa* are added.

During visits to the following herbaria specimens have been examined: Natural History Museum, London (BM), Brisbane (BRI), Berkeley (UC), Geneva (G), Gray Herbarium, Cambridge (A, GH), Honolulu (BISH), Kew (K), Lae (LAE), Manila (PNH), New York (NY), Paris (P), Sydney (SYD) and Utrecht (U), besides the specimens at Leiden (L) and the ones sent on loan from Bogor (BO) and Singapore (SING).

As a member of the 2nd Expedition of the Rijksherbarium to New Guinea in 1961/62, I had the opportunity to study *Epacridaceae* in the Cyclopo Mts, in the Eastern Highlands and in the Vogelkop Peninsula. During a 3-weeks stay in the Hawaiian Islands, thanks to the kind hospitality of Dr Otto & Isa Degener, Waialua, and of Mr Herbert Shipman, Hilo, I was able to visit Oahu, Kauai, Maui, and Hawaii, collecting 'pukeawe' from sealevel up to 3000 m in numerous places. Australian *Epacridaceae* were observed in the field during excursions with Mr S. L. Everist and Mr L. S. Smith around Brisbane, and with Mr K. Mair around Sydney. I wish to express my sincere thanks to all persons who helped me to perform these studies.

I. STYPHELIA

J. E. Smith, Spec. Bot. New Holl. (1793) 45, t. 14 et aut. sequ., *sensu* F. v. M., Fragm. 6 (1867) 50 (*incl. Astroloma* R. Br., *Cyathodes* Lab., *Leucopogon* R. Br., *Lisanthe* R. Br., *Melichrus* R. Br., *Stenanthera* R. Br.); Drude in E. & P., Pfl. Fam. 4, 1 (1889) 76; Koord., Exk. Fl. Java 3 (1912) 19; J. J. S., Nova Guinea 8, 4 (1912) 798; *ibid.* 12, 5 (1917) 539; *ibid.* 18 (1936) 123; Maiden & Betche, Census N.S. Wales Pl. (1916) 164; Steen., Bull. Jard. Bot. Btzg III, 13 (1933) 52; Back., Bekn. Fl. Java (em. ed.) 7 (1948) fam. 164, p. 1.

Lectotype species: *S. tubiflora* Sm.

Styphelia Sol. in Forst., Prod. (1786) 13 (*Stiphelia*) has no nomenclatural status.

F. v. Mueller (1867) grouped most of Brown's genera into *Styphelia*, but retained them at the sectional level. Bentham (Fl. Austr. 4, 1869) did not accept F. v. Mueller's classification, apparently for the sake of convenience. Later Drude (1889) followed F. v. Mueller with minor alterations, and this last classification was accepted by Maiden & Betche (1916).

KEY TO THE SUBGENERA AND SECTIONS

1. Flowers constantly 4-merous. *New Caledonia*
Subgen. *Cyathopsis* (Brongn. & Gris pr. gen.) Drude (*Type sp.*: *S. floribunda* (Brongn. & Gris) Sleum.).
1. Flowers generally 5-merous.
 2. Subtending bract and the two bracteoles inserted at some distance from the calyx. *Australia*
Subgen. *Lissanthe* (R. Br. em. Benth. pr. gen.) Drude (*Lectotype sp.*: *S. sapida* (R. Br.) F. v. M.).
 2. Subtending bract and bracteoles inserted immediately below the calyx.
 3. Subtending bract 1 (or rarely 0); bracteoles 2, strictly opposite. *Indochina, Burma, Siam, Malaysia, Melanesia (Bougainville), Australia (incl. Tasmania), New Zealand, New Caledonia, New Hebrides, Fiji*
Subgen. *Leucopogon* (R. Br. pr. gen.) Drude (*Lectotype sp.*: *S. lanceolata* Sm.).
 3. Subtending bract 1; bracteoles 3 or more, imbricate.
 4. Corolla short, tubular-funnel-shaped, or urceolate, or campanulate, glabrous or hairy inside, the hairs generally found above the middle. *SE. Australia (incl. Tasmania), SE. New Guinea, New Zealand (incl. Auckland, Campbell, Chatham, and Stewart Isl.), Micronesia (Marianas: Alamagan), Polynesia (incl. Hawaii, Society and Marquesas Isl., Rapa Isl.)*
Subgen. *Cyathodes* (Lab. em. R. Br. pr. gen.) Drude (*Lectotype sp.*: *S. billardieri* F. v. M. = *Cyathodes glauca* Lab.).
 4. Corolla ± elongate-tubular, provided with hairs, or with 5 (hairy or glandular) scales inside below the middle. *Australia (incl. Tasmania)*
Subgen. *Styphelia*. For the sections follow the key.
 5. Stamens far exserted; filaments elongate-filiform. Sect. *Styphelia*.
 5. Stamens included in the corolla tube, at most reaching the base of the corolla lobes; filaments short.
 6. Corolla tube (usually elongate) inside provided with 5 hairtufts or with a dense ring of hairs or with 5 hairy scales
Sect. *Astroloma* (R. Br. pr. gen.) Drude (*Type sp.*: *S. humifusa* (Cavan.) Pers.).
 6. Corolla tube inside either glabrous or with scattered hairs (no hairy scales).
 7. Corolla tube inside with 5 glandular scales
Sect. *Melichrus* (R. Br. pr. gen.) Drude (*Type sp.*: *S. procumbens* (Cavan.) Pers.).
 7. Corolla tube inside without such scales
Sect. *Stenanthera* (R. Br. pr. gen.) Drude (*Type sp.*: *S. pinifolia* (R. Br.) Spr.).

subg. LEUCOPOGON

(R. Br.) Drude in E. & P., Ph. Fam. 4, 1 (1889) 78. — *Leucopogon* R. Br., Prod. (1810) 541, nom. cons. (*lectotype sp.*: *S. lanceolata* Sm. = *Leucopogon lanceolatus* (Sm.) R. Br.); R. & S., Syst. 4 (1819) xlvi; Don, Gen. Syst. 3 (1834) 777; Miq., Fl. Ind. Bat. 2 (1859) 1052, incl. § *Stypheliopsis* Miq., l.c. and § *Anacyclodon* (Jungh.) Miq., l.c. 1053; Benth., Fl. Austr. 4 (1869) 176; Clarke in Hook. f., Fl. Br. Ind. 3 (1882) 477; K. & G., J. As. Soc. Beng. 74, ii (1905) 83; Ridl., Fl. Mal. Pen. 2 (1923) 223; Guillaumin, Bull. Soc. Bot. Fr. 88 (1941) 657; A. C. Smith, The Scientif. Monthly 73 (1951) 13; J. Arn. Arb. 22 (1952) 105; ibid. 36 (1955) 286. — *Styphelia* sect. *Leucopogon* (R. Br.) Maiden & Betche, Census New S. Wales Pl. (1916) 165. — *Anacyclodon* Jungh., Nat. Geneesk. Arch. N. I. 2 (1845) 49 (based on *A. pungens* Jungh., l.c.).

KEY TO THE ASIATIC AND MALAYSIAN SPECIES

1. Leaves sessile or almost so, with (very) numerous, approximate, equally delicate nerves, the individual course of which can hardly be traced.
 2. Leaves initially ciliate along the whole margin, at full maturity still so at least in the basal part. *New Guinea* I. *S. abscondita*
 2. Leaves eciliate from the beginning.
 3. Ovary glabrous. Style glabrous or patently short-hairy in the lower part. *Indochina, Lower Burma, Siam, Sumatra, Malay Peninsula, Banka, Billiton, Borneo* . . . 2. *S. malayana* var. *malayana*
 3. Ovary hairy all over the top. Style always patently short-hairy in the lower half. *New Guinea*
 2. *S. malayana* var. *novoguineensis*
 1. Leaves generally (shortly) petiolate, with fewer nerves, the inner 3—5(—7) straight and parallel from the base to the apex, stronger (or more conspicuous) than the outer ones which are fan-like diverging from them.

4. Leaves either ending in a very short (not caducous or breakable), callose, acute point or tip, or subacute to obtuse. *N. Borneo, Celebes, Philippines, Timor, New Guinea, Bougainville* 3. *S. suaveolens*
4. Leaves ending in a conspicuous hair- or needle-like, pungent and rather persistent (though breakable), 1—2 mm long point.
5. Leaves densely and rather coarsely serrulate-ciliate. Corolla 6(—7) mm. *E. Java* 4. *S. javanica*
5. Leaves whether or not finely and appressedly ciliolate. Corolla up to 4 mm.
 6. Leaves oblanceolate. (Corolla 3.3—3.5 mm.) *Timor, Alor* 5. *S. forbesii*
 6. Leaves all or most of them (in the same specimen) lanceolate or linear-lanceolate.
 7. Leaves rather densely arranged, (1—)1.5—2 mm wide. Corolla 2.5—2.7(—3) mm. *N. Australia, Wetar*. 6. *S. acuminata*
 7. Leaves densely to very densely, i.e. imbricately arranged, 2—3 mm wide. Corolla (3—)3.5 mm. *N. Borneo, SE. Celebes (Kabaena), Talaud Isl. (Karakelong), Sula Isl. (Taliabu), Moluccas (Amboin, Ceram, Buru), NW. New Guinea (Gebeh, Waigeu)* 7. *S. abnormis*

I. *Styphelia abscondita* J.J.S., Nova Guinea 18 (1936) 124, t. 33, 2.

NEW GUINEA. Northern part: Doormantop, 3250 m, Lam 1597 (BO, type; L).

Note. Possibly but a variety of *S. malayana* Jack.

- 2. *Styphelia malayana* (Jack) Spr., Syst. 4 (1827) Cur. post. 67 ('malaica'); F. v. M., Fragm. 6 (1867) 56; Drude in E. & P., Pl. Fam. 4, 1 (1889) 78 ('malayica'); Koord., Rec. Trav. Bot. Wallich* 3720 (2); Changi-Tanamerah, *Ridley* 1832.

ANAMBAS Isl. Jemaja, Letong, *Henderson* SF 20327.

SUMATRA. Westcoast: Taram, E. of Pajakumbuh, on sandstone, 500—1000 m, *Meijer* 6946, 7071. — Tapanuli: Dairi Lands, near top Dolok Sempalan, common, *Anonymous* (BO).

BANKA. Muntok, 4 m, *Bunnemeijer* 1475; *Teyssmann* s.n.; *Kornasi* s.n.; B(e)linju, 2 m, *Burger* 24.; Sg. Liat, *Berkhout* 512; *Teyssmann* s.n.; *Hetharia* 4; Lobok besar, *Kostermans & Anta* 168; Mt Maras, 600 m, *Kostermans & Anta* 1285; Djebus, *Teyssmann* 3359 (K); Serdang, *De Leeuw* 11; P. Lepar, 50 m, *Bunnemeijer* 2457; Aer Mesu, V. d. Vecht 9; Njamar, *Kobus* s.n.; no locality given: *Coert* 1654; *Ploem* s.n.

BILLITON. Manggar, *Burger* 1; *Ham* 15; no locality given: *Teyssmann* H. B. 11195; *Vorderman* s.n.

RJOW ARCH. P. Bintan, P. Udjian, *Bunnemeijer* 6441.

BORNEO. Sarawak: Kuching, Mt Santubong, summit, 800—850 m, *Sinclair* SF 38354; *Haviland* s.n.; *Anderson* 8357; Mt Bungoh, summit, 1000 m, *Brunig* S 9515; Bako Nat. Park, below 150 m, *Brunig* 4814; *Jacobs* 5489; *Purseglove* 4879; *ibid.*, Tanjong Po, *Brooke* 10576, 10623; Mt Dulit, 1230 m, in moss forest, *Richards* 1619; Miri Distr., top of Bt Lambir, 450 m, *Bakar* 3036; no locality given: B. S. 2230 Nat. coll.; *Beccari* P. B. 2109. — Western part: Singkawang, Pasir Pandjang, N. of Mempawa, 2 m, F. R. I. bb. 9778; *Polak* 281, 734, on sandy soil near sea; *Dunselman* 70. — Brunei: Bt Pasir Puteh, Tutong, *Ashton* BRUN 284. — Labuan: *Ridley* 9049; *Barber* s.n. — N. Borneo: Mt Kinabalu, 1220—2745 m, *Clemens* 10927 (A), 10972, 30938, 31894, 32338, 32740, 40689; *Haviland* 1263; *Gibbs* 4053. — Borneo, no locality indicated: *Lobb* s.n.; *De Vriese* s.n. — Karimata Arch.: P. Serutu, *Mondi* 173.

var. novoguineensis Sleum., *nov. var.* — A var. *malayana* praeccipue ovario per totum verticem piloso recedit. *Stylus* 1.5—2 mm longus, semper in inferiore media parte patenti-pilosus. *Fructus* maturus globularis, ruber, edulis, in vivo 3.5—4 mm diam. *Folia* 2.5—4.5 cm longa, (0.4—)0.5—1 cm lata interdum in eodem specimine pro parte multo angustiora et lanceolata.

NEW GUINEA. Northern part: Cyclopo Mts, *Dumas* 19 (BO, L); *ibid.*, S. slope of the Makanoi Ra., above Kotanica, 600—700 m, fl. fr. 17-7-1961, *van Royen & Sleumer* 6200 (A, BM, BO, CANB, G, K; L, type); LAE, UC, scattered in woody grassland on laterite soil; *ibid.*, *van Royen & Sleumer* 6200 a, with black spots of a fungus (*Polystomellaceae*, det. F. Petrak in litt.) on the leaves, rare.

Note. On the label of *Dumas* 19 an altitude of 1550 m is indicated. At this altitude, however, the Cyclopo Mts are all over covered by a dense (and partly even mossy) forest, as can be seen from the air photographs at hand; these forests are certainly no habitat for such a heliophilous species as is *S. malayana*.

3. *Styphelia suaveolens* (Hook. f.) Warb. in Sarasin, Reisen 2 (1905) 329, in text; Koord., Rec. Trav. Bot. Néerl. 7 (1910) 65, in text; Exk. Fl. Java 3 (1912) 22; J. J. S., Nova Guinea 8, 4 (1912) 798; Gibbs, J. Linn. Soc. Bot. 42 (1914) 107; Merr., En Born.

Formosa 30 (1940) 336. — *S. sp.*, Meijer Drees, Comm. n. 33 For. Res. Inst. Bogor (1951) 49.

AUSTRALIA. S. Queensland: Wallangara, cit. Bailey. — New S. Wales: Mt Koszusko to Ben Lomond. — NE. Victoria: Australian Alps. — Tasmania.

NEW ZEALAND. North and South Island.

BORNEO. N. Borneo: Kota Belud, 2590—2745 m, SAN 20406 Meijer; KEP 80358 Wyatt Smith; Mt Kinabalu, 2745—4000 m, Low s.n. (K, type of *Leucopogon suaveolens*); Haviland 1062; Holttum s.n.; Sinclair c.s. 9134; Clemens 10633 (UC), 10667, 27097, 27097 B, 27779, 28995, 29130, 30374, 30375, 32380, 50812, 50874, 50875; Carr SF 27523, 27602, 27618; Gibbs 4179, 4241; Whitehead anno 1888; Haslam s.n.; Topping 1695; Nat. coll. 52; Jacobs 5747; Collenette 781; SAN 29296 Meijer.

TIMOR. Western part: Fetin, 1800 m, Bosarchit, Kupang 8; Mt Mutis, 2300 m, De Voogd 2288; Stein 847 (B, †). — Eastern part: Huato Bulico, NW. of Tatamailau, 1800—3000 m, van Steenis 18374; Mt Tatamailau (Ramelan), 2600—2800 m, van Steenis 18409; Stein 1126 (B, †).

CELEBES. Central part: Enrekang, between Pintéalon, Pokapindjang and Tinábang, 2600—3000 m, Eyma 595; Mt Latimodjong, top, 3200—3300 m, Eyma 1039; Rantemario, 2700—3200 m, Kjellberg 3982a; Eyma 772. — Southwestern part: Peak of Bonthain, 2300—2890 m, Bünnemeijer 11861, 11896, 11930, 12184, 12220, 12254; Everett 43, 44, 80; van der Pijl 755; *ibid.*, S. top (Mt Lompobatang), 2700—2900 m, van Zijll de Jong 3; Monod de Froideville 232; Sarasin 1291 (K); Bauman-Houtman 181.

PHILIPPINES. Luzon: Benguet Prov., between Suyoc and Pauai, Merrill 4762; F. B. 14443 Darling; Bangui-noc, 2500 m, Loher 3784; Mt Singakalsa, 2300—2700 m, PNH 4447 Celestino; PNH 82428 Quisumbing & Sult. — Negros: Canlaon Volcano, 1950—2300 m (summit), Merrill Philip. Pl. 243 (PNH, type of *S. philippinensis*, †); *ibid.*, PNH 16696 Rabor; PNH 21954 Edaño. — Mindanao: Davao Prov., Mt Apo, dominant from 2600—2820 m, Koch s.n. (B, †); Copeland 1040, 1419; de Vore & Hoover 312 & 379 (cit. Merrill, not seen); Hosokawa 8562, 8596; Elmer 11389; Williams 2528; Clemens 15680; PNH 34625 Pancho; PNH 1469, 1545 Edaño. — Lake Lanao, 2300 m, PNH 1404 Edaño.

NEW GUINEA. Northwestern part: Arfak Mts, Anggi Lakes, 1800—2750 m, Gjellerup 1122 (BO, type of *S. spicata*; L); Prati anno 1908 (K); Kostermans 2094; Kanehira & Hatusima 13702 (= f. 7, FU), 14052 (A, BO); Mt Koëbré between Anggi Lakes, 2300 m, Sleumer & Vink 4278; Mt Sensenemés above Sureci, Anggi Gigi Lake, 2400—2750 m (top), Sleumer & Vink 4299; Mt Saru-mot near Iray, Anggi Gigi Lake, 2320 m, Sleumer & Vink 4447, in forest. — Western part: Wissel Lakes, Enarotali, Eyma 4781; *ibid.*, Mt Dejai, 3000 m, BW 3257 den Haan; *ibid.*, Tarapadimi, S. of Lake Tage, Eyma 5223 (BO, L; form with smaller leaves); Mt Carstensz, 3350—3810 m, B. Klöss s.n. (BM, type of *S. vandewateri*); *ibid.*, 'Carstenszweide', c. 3500 m, Dozy s.n.; *ibid.*, 'Dajakweide' & 'Merendal', 3700—4450 m, Wissel (Exp. Colijn)

5, 80, 81, 105, 119; *ibid.*, 'Zuidwand' & 'Gele Dal', 4500—4700 m, *Wissel* (*Exp. Colijn*) 56 (BO); Ilaga Valley, on airstrip at 2250 m, *Cooper* 32; Mt Doorman, 3250—3500 m, *Lam* 1616, 1648 (BO, type of *S. trilocularis* var. *quinquilocularis*; L). Habbema Lake area, 3000—3225 m, *Brass* 9033, 9135, 9459, 9460, 10667, 21113 (A); E. & NE. of Mt Wilhelmina top, 3560—3900 m, *Brass* & *Meijer Drees* 9911, 9931, 9932, 10302; Mt Wilhelmina, N. slope, 3650 m, *van Nouhuys anno 1909* (BO, lectotype of *S. obtusifolia*); *ibid.*, top, 4500 m, *von Römer* (*leg. Lorentz*) 1341 (BO, syntype of *S. obtusifolia*); *ibid.*, S. slope, 4250 m, *Brass* & *Meijer Drees* 10099; Mt Goliath, 3000—3500 m, *de Kock* 59 (BO, type of *S. trilocularis*), 60 (BO, type of *S. obtusifolia* var. *hypoglauca*); Wichmann Mts, 3000 m, *Pulle* 970; Oranje Mts, Quarles Valley, 3800 m, *Pulle* (*leg. Versteeg*) 2529; Hubrecht Mts, 3100 m, *Pulle* 2413. — Central part: Star Mts, Mt Antares, 3400 m, *Kalkman* 4496. — Western Highlands: Wahgi Valley, NGF 5194 *Womersley*; Laiagam Subdistr., Yobobos grassland area, 2600 m, *Hoogland* & *Schodde* 7451, 7589; Kandep Valley, S. of Laiagam, 2285 m, *Robbins* 3259; Wabag Subdistr., Mt Sugarloaf, 2900—3650 m, *Hoogland* & *Pullen* 7007, 7119; Minj Subdistr., Central Kubor Ra., Mt Kinkain, 3600 m, *Pullen* 217; Hagen subdistr., above Tomba, 2440 m, *Robbins* 278; S. slopes of Mt Hagen, 2700 m, *Hoogland* & *Pullen* 6045; *Robbins* 298; Mt Hagen Ra., 3350—3500 m, *Shaw Mayer* s.n. (BM). — Eastern Highlands: near Mt Kerigomna, 3000 m, *Hoogland* & *Pullen* 5541; Mt Wilhelm, E. slope and top, 3000—4675 m, *Hoogland* & *Pullen* 5785; *Anderson* JARA 24; *Walker* 216; *Borgmann* 21; *Robbins* 1162; *Brass* 29803, 29927, 30548; *ibid.*, 4480 m, *Brass* (*leg. Vandensel* & *Collins*) 30012; NGF 8924 *Womersley*; *Hoogland* & *Pullen* 5646; *Tuckwell* s.n.; *Barrett* 15 p.p.; NGF 15141 *van Royen*; NGF 16007 *van Royen*; Dunantina Valley, hills above Yanofi, 1830 m, *Robbins* 902; Sunabiga Rock, near Yontegi village, 2050 m, *Hoogland* & *Pullen* 5323; Mt Michael, 3290—3650 m, NGF 11482 *Womersley*; *Brass* & *Collins* 31275; Mt Otto, 3470—3540 m, *Brass* 30989; *Brass* & *Collins* 31012; Okapa area, road to Kainantu, *Brass* 31880. — Southern Highlands: Mt Giluwe, 3050—3150 m, *Schodde* 1723, 1856. — Morobe Distr.: Mt Saruwaged, 2400—3600 m, *Keysser* 14 (B, †); *Clemens* 7418; *Lane-Poole* 501 (BRI); *ibid.*, Mt Enggom, 3700 m, NGF 16213 *van Royen*; Ulap Trail, *Clemens* 41147 (A, UC); Rawlinson Ra., *Clemens* 41380 (A, UC), 41941 (A, UC); Busu R., Tamunac camp, 2135—2745 m, *Clemens* 5304 (A); Samanzing vicinity, 2440 m, *Clemens* 9344 A (A). — Central Distr.: Mt Scratchley, 3050—3960 m, *Giulianetti* anno 1896; Murray Pass, Wharton Ra., 2840 m, *Brass* 4199; Mt Victoria, c. 3960 m, *McGregor* anno 1889; Mt Knutsford, *McGregor* anno 1889; Mt Albert Edward, 3680 m, *P. J. Money* 7 (SYD); *Brass* 4219, 4419 A (BRI, NY). — Milne Bay Distr.: Mt Maneao, 2230—2780 m, *Cruttwell* 529, 738; *Brass* 22235, 22605; Mt Simpson, 2590 m, *Cruttwell* 59.

SOLOMON ISL. Bougainville: Mt Balbi, 150 m, *Kimmorley* s.n. (LAE).

4. Styphelia javanica (De Vriese) J. J. S., Ic. Bog. 4, 1 (1910) 82. — *Anacyclodon pungens* Jungh., Nat. Geneesk. Arch. N.I. 2 (1845) 49. — *Pentachondra javanica* Zoll., Nat. Geneesk. Arch. N.I. 2 (1845) 576, repr. Flora 30 (1847) 601, nom. ill. (based on *Anacyclodon pungens* Jungh.). — *Leucopogon javanicus* De Vriese in Miq., Pl. Bot. 42 (1914) 107; Merr., En. Born. (1921) 467; Masam., En. Phan. Born. (1943) 577. — *S. moluccana* (Scheff.) J. J. S., Ic. Bog. 4 (1910) 82, in text; Nova Guinea 8, 4 (1912) 798; Lam & Holthuis, Blumea 5 (1942) 224.

BORBEO. N. Borneo: 'North coast', Low s.n. (K, type of *Leucopogon lancifolius*); *ibid.*, Burbidge s.n. Jesselton, 100 m, Gibbs 2578; Clemens 9576, 11264; Haslam s.n.; Wood 2055; Balambangan I., B. Kloss SF 19263; Creagh s.n. (BM); Frazer s.n.

CELEBES. Southeastern part: Kabaena I., Mt Sangia Wita, 700—900 m, Elbert (Gründler) 3483.

MOLUCCAS. Ceram: western part, Hoalmoal, 500—1000 m, F.R.I. bb. 20059 Salverda — Talaud Isl.: Karakelang, E. slope Mt Biapi, 400 m, Lam 3280. — Sula Isl.: Taliabu, Atjeh (Exp. van Hulstijn) 53. — Buru: Siahoni, 50 m, F.R.I. bb. 41480; Kajeli, Teysmann s.n.; no locality given: D'Urville s.n. (P). — Amboin: Leahari, 0—100 m, Kornasi (Exp. Rutten) 1148; Manipa I., 50 m, Curran 3504 (A).

NEW GUINEA. Gebeh: Teysmann H.B. 7583 (BO, type of *Leucopogon moluccanus*; K, L). — Waigeu: Majalibis Bay, village Go, Cheesman 1216 (BM); *ibid.*, ESE. of Kabaré, c. 300 m, van Royen 5411; no locality given: D'Urville & Lesson anno 1825 (P, type of *Leucopogon abnormis*).

Note. Similar in leaf to *S. esquamata* (R. Br.) Spr. (New S. Wales) which, however, has obtuse bracteoles and sepals and a very slender, elongate style; equally similar, if not related, to *S. multiflora* (R. Br.) Spr. (W. Australia), the leaves of which are more strongly nerved, subpetiolate or distinctly narrowed at the base, the style being slender and c. 2 mm long. A third apparently close species is *S. leptospermoides* (R. Br.) Spr. from Queensland with smaller leaves, the style 1—1.3 mm long, and the fruit attenuate at the top, not truncate as in *S. abnormis*.

NEW COMBINATIONS IN STYPHELIA subg. LEUCOPOGON

Styphelia albicans (Brongn. & Gris) Sleum., comb. nov. — *Leucopogon albicans* Brongn. & Gris, Bull. Soc. Bot. Fr. 11 (1864) 67; Ann. Sc. Nat. sér. 5, 2 (1864) 155.

Lectotype: Vieillard 833 (P, SYD).

Styphelia behrii (Schlechtendal) Sleum., comb. nov. — *Pentataphrus behrii* Schlechtendal, Linnæa 20 (1847) 618. — *Stenanthera conostephioides* Sond. in Lehm., Pl. Preiss. I (1844/45) 296. — *S. sonderi* F. v. M., Fragm. 6 (1867) 36; Sec. Syst. Census (1889) 178. — *Astroloma conostephioides* (Sond.) F. v. M. ex Benth., Fl. Austr. 4 (1869) 158.

In *Styphelia*, the epithet 'conostephioides' is already occupied by *S. conostephioides* (DC. 1839) F. v. M. 1867.

Styphelia cinerea (Pritz) Sleum., comb. nov. — *Leucopogon cinereus* Pritz, Bot Jahrb. 35 (1904) 472, f. 52 A—D.

Styphelia commutata Sleum., nom. nov. — *Leucopogon compactus* Stschegl., Bull. Soc. Nat. Moscou 32 (1859) i, 13. — *S. compacta* (Stschegl.) F. v. M., Syst. Census (1882) 106; Sec. Syst. Census (1889) 178, non (R. Br.) Spr. (1824), based on *Astroloma compactum* R. Br. (1810).

Styphelia concava (Schltr.) Sleum., comb. nov. — *Leucopogon concavus* Schltr., Bot Jahrb. 39 (1906) 222.

Styphelia coryphila (Guillaum.) Sleum., comb. nov. — *Leucopogon coryphilus* Guillaum., Bull. Mus. Nat. Hist. Paris sér. 2, 5 (1933) 248.

Styphelia dammarifolia (Brongn. & Gris) Sleum., comb. nov. — *Leucopogon dammarifolius* Brongn. & Gris, Bull. Soc. Bot. Fr. 11 (1864) 67; Ann. Sc. Nat. sér. 5, 2 (1864) 154.

Lectotype: Vieillard 838 (L, P).

Styphelia dielsiana (Pritz) Sleum., comb. nov. — *Leucopogon dielsianus* Pritz, Bot Jahrb. 35 (1904) 476.

Styphelia elatior (Sond.) Sleum., comb. nov. — *Leucopogon elatior* Sond. in Lehm. Pl. Preiss. I (1844/45) 314.

Styphelia elliptifolia Sleum., nom. nov. — *Leucopogon ellipticus* Guillaum., Bull. Soc. Bot. Fr. 88 (1941) 658, non *Styphelia elliptica* Sm. (1804).

Styphelia enervia (Guillaum.) Sleum., comb. nov. — *Leucopogon enervius* Guillaum., Bull. Soc. Bot. Fr. 88 (1941) 658.

Styphelia exserta (F. v. M.) Sleum., comb. nov. — *Soleniscia pulchella* Stschegl., Bull. Soc. Nat. Moscou 32 (1859) i, 3, non *Styphelia pulchella* (Sond.) F. v. M. (1867). — *Leucopogon exsertus* F. v. M., Fragm. 3 (1863) 143. — *S. leucopogon* F. v. M., Fragm. 4 (1864) 97; *ibid.* 6 (1867) 31; Benth., Fl. Austr. 4 (1869) 149, nom. ill., based on *Leucopogon exsertus* F. v. M. (1863).

Styphelia fasciculata (Forst. f.) Sleum., comb. nov. — *Epacris fasciculata* Forst. f., Prod. (1786) 13. — *Leucopogon fasciculatus* (Forst. f.) A. Rich. Essai Fl. Nouv.-Zél. (1832) 215; A. Cunn. Ann. Nat. Hist. 2 (1838) 47. — *Cyathodes fasciculata* (Forst. f.) Allan, Fl. New Zeal. 1 (1961) 515.

Styphelia floribunda (Brongn. & Gris) Sleum., comb. nov. — *Cyathopsis floribunda* Brongn. & Gris, Bull. Soc. Bot. Fr. 11 (1864) 66; Ann. Sc. Nat. sér. 5, 2 (1864) 153.
Lectotype: Vieillard 834 (A, L, P, SYD).

Styphelia hamulosa (Pritz) Sleum., comb. nov. — *Leucopogon hamulosus* Pritz., Bot. Jahrb. 35 (1904) 478.

Styphelia hispida (Pritz) Sleum., comb. nov. — *Leucopogon hispidus* Pritz., Bot. Jahrb. 35 (1904) 478.

Styphelia lasiophylla (Stschegl.) Sleum., comb. nov. — *Leucopogon lasiophyllus* Stschegl., Bull. Soc. Nat. Moscou 32 (1859) i, 16.

Styphelia longistyliis (Brongn. & Gris) Sleum., comb. nov. — *Leucopogon longistyliis* Brongn. & Gris, Bull. Soc. Bot. Fr. 11 (1864) 67; Ann. Sc. Nat. sér. 5, 2 (1864) 154.
Lectotype: Vieillard 836 (P, SYD).

Styphelia macrocarpa (Schltr) Sleum., comb. nov. — *Leucopogon macrocarpus* Schltr., Bot. Jahrb. 39 (1906) 223.

Styphelia mollis (Pritz) Sleum., comb. nov. — *Leucopogon mollis* Pritz., Bot. Jahrb. 35 (1904) 471.

Styphelia nesophila (DC.) Sleum., comb. nov. — *Leucopogon nesophilus* DC., Prod. 7 (1839) 752. — *Leucopogon fraseri* A. Cunn., Ann. Nat. Hist. 2 (Sept. 1838) 47, non D.C., Prod. 7 (Dec. 1839) 753 ("Leucopogon fraseri" A. Cunn. in litt. 1836" which is *Styphelia multiflora* (R. Br.) Spr.), later homonym. — *S. fraseri* (A. Cunn.) F. v. M., Syst. Census (1882) 107, non F. v. M., Fragm. 6 (1867) 56 (based exclusively on *Leucopogon fraseri* DC.). — *Cyathodes fraseri* (A. Cunn.) Allan, Fl. New Zeal. 1 (1961) 517.

KEY TO THE SPECIES

1. Leaves generally clustered at the ends of the year's growth so as to appear almost whorled (but exceptionally rather more scattered in *S. straminea*). (Outer nerves branched).
 2. Leaves oblong-linear, mucronate or at least mucronulate, (1—)1.5—2.5(—3.6) by 0.2—0.4(—0.5) cm. Tasmania *S. billardieri* F. v. M.
 2. Leaves narrowly to broadly oblong, obtuse or with a small apical callose point, (0.5)—0.6—1 (rarely up to 1.2) by (0.2)—0.3—0.4 cm. Tasmania *S. straminea* (R. Br.) Spr.
1. Leaves scattered or crowded throughout the branchlets.
 3. Nerves on the undersurface of the leaves few and thickish, not branched distally. (Leaves caducously ciliate or ciliolate; if persistently longish and patently subserrulate-ciliate all along the margin, see *S. douglasii*).
 4. Leaves obtuse by a callose apical point, (2—)3—5 by c. 0.5 mm (short-pubescent between the nerves underneath). New Zealand, Stewart I., Auckland I., Campbell I. *S. taxifolia* Sleum.
 4. Leaves acutely apiculate to sharply mucronate.
 5. Leaves besides the midrib with distinct marginal nerves, sometimes moreover with another, much fainter nerve between (so that the leaves become sub-5-nerved), whitish-glaucous or almost silvery (not properly pubescent) beneath.
 6. Leaves ± 5 mm wide. New Zealand. *S. minuta* Sleum.
 6. Leaves 1—1.5 mm wide. Tasmania *S. dealbata* (R. Br.) Spr.
 5. Leaves with at least 5 distinct approximate nerves, subglaucous or greenish (glauberous or pubescent) beneath.
 7. Leaves short-pubescent between the nerves underneath. Tasmania *S. abietina* Lab.
 7. Leaves quite glabrous beneath.
 8. Bracteoles remote, i.e. not completely covering the pedicel. Pedicel 2—4 mm. Tasmania *S. remota* Sleum.
 8. Bracteoles close together, entirely covering the very short pedicel.
 9. Leaves 0.8—1.3 by 0.1—0.15 cm. SE. Australia (Victoria), Tasmania. *S. oxycedrus* Lab. var. *oxycedrus*
 9. Leaves 0.4—0.8 by 0.05—0.1 cm. Tasmania. *S. oxycedrus* Lab. var. *parvifolia* (R. Br.) Sleum.
 3. Outer nerves on the undersurface of the leaves branched outward at least distally (less distinct so in microphyllous juvenile forms of *S. juniperina*).
 10. Leaves ± imbricately arranged, still longish (0.1—0.15 mm) and ± patently subserrulate-ciliate when adult. Hawaii Isl. *S. douglasii* (Gray) F. v. M. ex Skottsb.
 10. Leaves less densely arranged, not imbricate, when adult not ciliolate.
 11. Corolla tube broadly campanulate.
 12. Leaves ending in a callose bluntnish point. Stigma subcapitate. Chatham I. *S. robusta* (Hook. f.) Sleum.
 12. Leaves ending in a markedly pungent point. Stigma ± truncate. New Zealand, Stewart I. *S. juniperina* (Forst.) Pers.
 11. Corolla tube ± narrowly tubular-subcampanulate.
 13. Leaves linear to linear-lanceolate, markedly and pungently pointed.

14. Corolla 5—5.5(—6) mm long in all, practically glabrous inside. Leaves \pm 2 mm wide.
Society Isl. (*Tahiti*) *S. pomarae* (A. Gray) Moore.
14. Corolla 3—4 mm long in all.
 15. Branchlets glabrous. Corolla 3 mm, glabrous inside. *Tubuai Isl.* (*Rapa*).
S. rapae Sleum.
15. Branchlets subdensely short-hairy. Corolla 3.5—4 mm.
 16. Leaves (8)—10—15 mm long. Corolla subdensely hairy at the throat inside.
SE. New Guinea *S. brassii* Sleum.
16. Leaves 6—8(—12) mm long. Corolla practically glabrous inside. *Society Isl.*
 (*Tahiti*, *Moorea* (*Eimeo*), *Raiatea*)). *S. brevistyla* Moore
13. Leaves mostly oblong, obovate-oblong or oblanceolate, elliptic or even ovate, rarely
 lanceolate, apex obtuse or shortly pointed by the midrib which is protracted into a
 callose, not properly pungent kind of mucro.
 17. Corolla 2.5 mm long in all. *Marianas* (*Alamagan Isl.*).
S. mariannensis (Kaneh.) Kaneh. & Hatus.
17. Corolla (3—)3.5—4(—4.5) mm long on all.
 18. Leaves oblong-lanceolate or oblanceolate, rarely lanceolate, tip generally
 mucronulate, rarely rather blunish, *Hawaii Isl.*, *Marquesas Isl.* (*Nukuhiwa*).
S. tameiameiae (Cham.) F. v. M. var. *tameiameiae*
18. Leaves ovate or mostly ovate-elliptic or elliptic, tip very shortly mucronulate
 or mostly blunt. *Hawaii Isl.*
S. tameiameiae (Chem.) F. v. M. var. *brownii* (A. Gray) St. John

Styphelia douglasii (A. Gray) F. v. M. ex Skottsb., Act. Hort. Gothob. 2 (1925) 255; Medd. Göteborgs Bot. Trädgård. 6 (1930) 52; Act. Hort. Gothob. 10 (1936) 152; Hochr., Candollea 6 (1936) 470; St. John, Occ. Pap. Bern. P. Bish. Mus. 17, 7 (1942) 84, incl. var. *struthioloides* (A. Gray) St. John; Skottsb., Medd. Göteborgs Bot. Trädg. 15 (1944) 426. — *Cyathodes imbricata* Stschegl., Bull. Soc. Nat. Moscou 32 (1859) 1, 10, non *Styphelia imbricata* (R. Br.) Spr. 1824; Mann, Proc. Am. Ac. 7 (1867) 188; Hillebr., Fl. Hawaiian Isl. (1888) 273, incl. var. *struthioloides* (A. Gray) Hillebr.; Rock, Ind. Trees Hawaiian Isl. (1913) 76, 79, 82; Degener, Pl. Hawaii Nat. Park (1930) 247. — *Cyathodes imbricata* Stschegl. var. *volcanica* Lévl. in Fedde, Rep. 10 (1911) 155. — *Cyathodes douglasii* A. Gray, Proc. Am. Ac. 5 (1862) 325, incl. var. *struthioloides* A. Gray l.c.; Wawra, Flora 56 (1873) 59. — *S. grayana* Rock, Ind. Trees Hawaiian Isl. (1913) 366, nom. ill.; Kraebel, Hawaiian For. Agr. 19 (1923) 4.

Cyathodes douglasii was described by Asa Gray from "Hawaii, on Mauna Loa and Mauna Kea, also Maui, on Haleakala". On the type sheet in his herbarium are 5 specimens, or syntypes; on one of them is annotated by A. Gray himself "Mauna Loa, Wilkes Exp. C. douglasii n. sp.", on another "Maui", and on a third (the right one at the bottom) "leg. Douglas, *Cyathodes douglasii* n. sp."; two other specimens are without annotation. Of these I consider the specimen collected by Douglas as the holotype (lectotype). Douglas collected it on Mauna Kea; his specimens from there in other herbaria (G, K) bear the number 19, which is cited as type for *Cyathodes imbricata* Stschegl.

The type sheet of *Cyathodes douglasii* var. *struthioloides* in A. Gray's herbarium bears several specimens, all collected by the Wilkes Exp. on Mauna Kea, and but slightly different from Douglas' material.

The species has been recollected on Mauna Kea by a number of botanists since. In 1962 I had the privilege to investigate numerous specimens on the E. slope of Mauna Kea between 1900 and 3000 m, among these several more decumbent (Sleumer 4556) or loosely branched (Sleumer 4554) 'struthioloides' forms, which are connected with the 'typical' erect and compact form by many intergrades, and cannot be separated from it.

The specimen of *Cyathodes douglasii* var.? from Kauai, collected by the Wilkes Exp. and mentioned by Asa Gray under his var. *struthioloides* ("perhaps a form on the mountains of Kauai") is also preserved in his herbarium. This is a plant slightly different by its trailing habit and less coriaceous leaves, which are rather greyish beneath in dry specimens, and apparently collected in a swampy habitat. Similar specimens were collected on Kauai by W. Hillebrand on the summit of Mt Eeka at 1830 m, by J. F. Rock (5526) in the Kauluwehi Swamp and by C. N. Forbes (880) in the Alakai Swamp. The same form exists on W. Maui on the open bog of the summit of Puukukui at c. 1740 m, collected there a.o. by Wilbur & Webster (802). Rock mentions the plants from Puukukui and from the great bog of Waialeale on Kauai at c. 1525 m (collected there before him by Wawra in 1871, nr. 2182) under the name of var. *struthioloides* in his Ind. Trees Hawaiian Isl. on p. 76 and 79, but this epithet cannot be applied to this form of swampy ground at relatively low altitudes for the reasons given above. Having failed to meet this special form during my short visit to the Alakai Swamp, I leave it to the Hawaiian botanists to investigate it more closely, especially as to a possible ingressions of *Styphelia tameiameiae*. The form found on swampy ground on Molokai differs from the one living on Hawaii and Maui by slightly wider leaves. There are several sheets of *Cyathodes douglasii* annotated by Asa Gray in the herbaria of Torrey and Crooke, deposited in the New York Botanical Garden — possibly syntypes or even isotypes —, "C. douglasii n. sp., Mts of E. Maui" (apparently collected by the Wilkes Exped.), and from "Sandwich Isl.", and var. *struthioloides* from "Sandwich Isl."

Cyathodes imbricata var. *volcanica* Lévl. is also based on a plant from Mauna Kea, collected at c. 3000 m by Faurie (442 & 445, A, G, NY, P).

The transfer of *Cyathodes douglasii* to *Styphelia* was made first by Skottsberg (1925) and again by Hochreutiner (1936); Hochreutiner 3565 from Kauai, cited by himself under *Styphelia douglasii*, however, certainly belongs to *Styphelia tameiameiae*. Besides from Hawaii, *Styphelia douglasii* in its strict circumscription is known from Molokai, Maui, and Kauai, and limited there to the highest parts from c. 2100—3000 m, along gulches sometimes down to c. 1900 m. In their lower parts, from sealevel up to c. 1200 (exceptionally up to 2150) m, lives *Styphelia tameiameiae*. Specimens intermediate between *S. douglasii* and *S. tameiameiae* to various degree were found by the author on the slopes of Mauna Loa, Mauna Kea, and Haleakala between 2100 and 2600 m. The distinction of the two species is based on the following characters:

Styphelia douglasii: —

Rather compact, sometimes cushion-forming, erect shrub with coriaceous, stiff leaves at high altitudes (2400—3000 m) on rock lava and cinders, more loosely branched, or sometimes decumbent and with less coriaceous leaves and slender, elongate branchlets at 1900—2400 m, in dry places, similarly trailing at lower altitudes (1400—1830 m) in swampy places. Leaves densely to imbricately arranged, uniformly lanceolate, apex elongate, pungent, nerves few, outer ones only branched outwards, edge persistently subserrulate-cili(ol)ate, generally of a yellowish-greenish, often rather pale colour, slightly or hardly greyish beneath.

On Hawaii, Maui, Kauai, and Molokai.

Styphelia tameiameiae: —

Generally loosely branched, spreading and ± erect shrub, sometimes a treelet with a slender stem up to 3 m high, from sealevel to c. 1200 m, exceptionally at higher altitudes up to 2150 m (Hawaii; E. slope of Mauna Kea at Puuoo and Huikao, Sleumer 4558); occasionally in a dwarf, more trailing form on bogs (Oahu), parallel to the one found in *S. douglasii* in similar places. Leaves ± patently, laxly to subdensely arranged, variable in shape and size, generally subcoriaceous and lanceolate-oblong or oblong, more rarely (especially at higher altitudes) elliptic or subovate-elliptic, apex blunt to mucronulate by the protracted midrib, hardly or not properly pungent, nerves rather numerous, much fan-like branched, edge cili(ol)ate in juvenile stages, becoming eciliate and quite entire with age, dark to medium green, often glaucous or even silvery-grey beneath, generally on clayey (laterite) ground, or on relatively fresh lava. On Hawaii, Maui, Kauai, Molokai, Oahu, and Lanai.

Both species and their hybrids are gynodioecious. During my stay in February/March I found the profusely flowering specimens generally to be ♀♀, sometimes bearing young and/or a few almost mature fruits. The profusely fruiting specimens with mature fruits usually were ♀♀, and mostly had no or but few flowers at that time. The same was found in apparently hybrid populations between the two species. In the ♀ flower the anthers are well developed (± 1 mm) and full of pollen; in the ♀ flower the anthers are reduced in size (± 0.5 mm) and empty. The ovary is the same in ♀♀ and ♀♀ flowers. No sharp difference can be found between the fruits of *S. douglasii* and *S. tameiameiae*, though the ones of *S. douglasii* seem to be larger in general. A maximum of size in fruits of *S. tameiameiae* with 11 by 9 mm I found on the above mentioned specimen at 2150 m on Mauna Kea. The colour varies from dark purple to pink and pure white in both

species. During the drying process, i.e. when preparing specimens for herbarium purposes, the leaves of *S. douglasii* remain almost entirely on the branchlets, whilst those of *S. tameiameiae* in part go off easily.

Styphelia robusta (Hook. f.) Sleum., comb. nov. — *Cyathodes robusta* Hook. f., Handb. N. Zeal. Fl. (1864) 177; Cheeseman, Man. N. Zeal. Fl. (1906) 411; Allan, Fl. Exp., GH, type of *Cyathodes pomarae*; K, NY); crêtes de l'Aorai, 1800 m, fr., & au fond de la vallée de Orofero, col de Urechiro, 1100 m, fl., Nadeaud 403 (G, L; P, type of *Cyathodes tahitensis*); S. of Mt Orohena, top of ridge, 1650 m, MacDaniels 1327, 1479; Mt Aorai, 1800—2050 m, E. H. Quayle 35; McCormish 1, 2; McKee 3051; crêtes de Pirae, 1200 m, Nadeaud anno 1898; no locality given: Nelson s.n.; Grandjean anno 1893; Ribourt 52; Vesco anno 1897.

The leaves of *S. pomarae* show an elongate, needle-like, and breakable point, which, once broken, bears something like a tuft of 'hairs'; in reality these are, however, the outstanding sclerotic fibres accompanying the vessel of the midrib.

Styphelia rapae Sleum., nov. spec.—Frutex c. 1 m altus. Ramuli graciles, subdense foliati, apicibus glabri. *Folia* ± patentia, linearia vel lanceolato-linearia, apice breviter acuminata et in acumen rigidum achlorophyllum pungentem (0.5—1 mm longum) extenuata, basi subtruncata, coriacea, rigida, ab initio eciliata et glabra, supra in secco saturata brunnea et lucidula, subtus intra nervos albido-cinerascentia vel glaucescentia, 1—1.2(—1.4) cm longa, 1—1.5 mm lata, iis *S. brassii* et *S. juniperinae* simillima, costa et nervis lateralibus 2—3-paribus marginem parallelis supra saepius leviter impressis, subtus parce prominulis, nervis exterioribus 1 vel 2 plerumque in superiore laminæ dimidio pauceramosis. *Floris* solitarii, in axillis superioribus paucis orti, subsessiles.

Bracteolae 7—10, ovatae usque oblongo-ovatae, haud vel indistincte ciliolatae, summae usque ad 1.5 mm longae, sat obscure longitudinaliter venosae. *Sepala* ovato-oblonga, obtusa, ciliolata, ± 1.7 mm longa. *Corolla* inferne tubulosa, ad lobos infundibuliformi-expansa, cremeo-albida vel lutescens, tota 3 mm longa, dimidio paullo profundius 5-partita, utrinque glabra, tubo sepalis inclusa, lobis denique subreflexis. *Antherae* anguste oblongae, 0.7 mm longae; filamenta filiformia, c. 0.5 mm longa, e corollae tubo vix exserta. *Ovarium* ovoideum, glabrum, c. 0.7 mm diam., stylo cum ovario sat abrupto, crasso, 1—1.2 mm longo. *Discus* tenuis cupulatus, superne 5-lobus. *Fructus* depresso-globosus, c. 3 mm altus, c. 4 mm diam.

TUBuai Is. Rapa I.: Kaimaru mountain ridge, 180 m, fl. 2-11-1921, Stokes 400 (BISH, UC); *ibid.*, Area, hillside near sea, 7—30 m, fl. fl. 6-11-1921, Stokes 421 (BISH, type), mentioned by F. Brown, Bern. P. Bish. Mus. Bull. 130 (1935) 218 sub *S. acerosa* var. *oxycedrus*.

S. rapae, as to leaf-characters, certainly forms a coherent group with *S. juniperina* (New Zealand, Stewart I.; corolla decidedly campanulate, branchlets puberulous), *S. brassii* (SE. New Guinea; corolla tubular-subcampanulate, branchlets puberulous, bracteoles distinctly ciliolate), and *S. brevistyla* (branchlets short-hairy; corolla practically glabrous inside), but is more distant from *S. oxycedrus* Lab. (SE. Australia, Tasmania; nerves not branched) and from *S. pomarae* (Society Isl.; leaves with an elongate, fine, breakable point). In habit, however, all these species are apparently very similar.

8. *Styphelia brassii* Sleum., nov. spec. — Frutex vel arbuscula usque ad 6 m alta. Ramuli graciles, ad apices minute patenter puberuli, ad partes vetustiores cito glabrescentes et corticati, cortice nigrescenti longitudinaliter fisso. *Folia* subdense aggregata, patentia vel subreflexa, linearia vel lanceolato-linearia, apice breviter acuminata et in acumen rigidum achlorophyllum pungentem (0.5—1 mm) extenuata, basi brevissime lateque in petiolum subgracilem 0.5—1 mm longum attenuata, coriacea, rigida, integra, initio caduce ciliata, maturitate omnino glabra, supra in sicco brunneo-olivacea et lucida, subtus griseo-glaucous, (0.8—)1—1.5 cm longa, 1—1.5 mm lata, costa nervisque lateralibus 2—3-paribus margini parallelis supra vix impressis, subtus minute sed bene visibiliter prominulis, exterioribus 1 vel 2 generaliter certe in superiore dimidio marginem versus ramosis, in foliis recentissimis saepius subramosis. *Flores* solitarii in axillis 3—6(—8) superioribus orti, subsessiles. Bracteolae basales 7—10, imbricatae, pedunculum vix 1 mm longum includentes, ovatae vel oblongo-ovatae, obtusae, ciliatae, 1—1.5 mm longae, inferiores minores. *Sepala* oblonga, obtusa, ciliata, ± 1.8 mm longa. *Corolla* tubuloso-subcampanulata, alba, tota 3.8—4 mm longa, ± usque ad medium 5-loba, extus glabra, intus ad lobos et superiorem dimidiad partem tubi subdense pilis mollibus crispulis induita, tubo brevissime vel vix e sepalis exerto. *Antherae* anguste oblongae, 1—1.2 mm longae; filamenta filiformia, glabra, 0.5 mm longa et e tubo corollae exserta. *Ovarium* late obovoidem, glabrum, c. 0.7 mm longum, superne in stylum sat gracilem glabrum 0.6—0.7 mm longum abiens. *Discus* tenuis, cupulatus, usque ad medium 5-lobus. *Fructus* globosus, albidos, maturitate purpurascens, c. 4 mm diam., endocarpio duro semina 2 vel 3 continente, mesocarpio tenui.

NEW GUINEA. Southeastern part: Milne Bay Distr., Mt Diriwa, Cruttwell 677; Mt Maneao, 2750—2895 m, Brass 22274 (A; L, type; LAE); Cruttwell 781; Mt Simpson, 2590 m, Cruttwell 59a (K).

***Styphelia brevistyla* J. W. Moore, Bull. Bern. P. Bish. Mus. 102 (1933) 36. — *Cyathodes tameameiae* Cham. var. *societatis* A. Gray, Proc. Am. Ac. 5 (1862) 325; Nadcaud, En. Pl. Tahiti (1873) 62; Drake del Castillo, Fl. Polynésie Franç. (1893) 116.**

SOCIETY IS. Tahiti: crêtes de Haamuta, 900 m, *Nadeaud* 404 (G, L, P); no locality given: *Vesco anno 1847*. — Raiatea: Mt Temehani plain, 470 m, *J. W. Moore* 106 (BISH, type of *Styphelia brevistyla*); *ibid.*, on high moor at 750 m, *H. St. John* 17293 (BISH, K); no locality given: *Herb. Savatier* 839 (P). — Moorea (Eimeo): *Pickering s.n.* (U.S. Expl. Exp., GH, type of *Cyathodes tameiameiae* var. *societatis*; K, NY, P).

The type and isotype material of *Cyathodes tameiameiae* var. *societatis* consists of two forms, one with narrower, the other with broader leaves. Partly they show a distinct, stiff mucro, as found in the holotype of *Styphelia brevistyla* and the plant collected by *Vesco*, partly they have a finer, needle-like, and breakable point as found in *Styphelia pomarae* and in *Nadeaud* 404.

A. Gray says, that the U.S. Expl. material of his var. *societatis* came "from Eimeo and probably Tahiti". With the scanty material at hand, it is impossible to say, if next to *Styphelia brevistyla* — possibly restricted to Raiatea and Moorea (Eimeo) — there exists a form with smaller leaves and smaller corollas, belonging to *Styphelia pomarae*, on Tahiti.

Styphelia mariannensis (Kanch.) Kaneh. & Hatus., Bot. Mag. Tokyo 56 (1942) 484, in text. — *Cyathodes mariannensis* Kanch., *ibid.* 48 (1934) 734, f. 5 (pessima); Kanch., J. Dept Agr. Kyushu Univ. 4 (1935) 386.

MARIANAS. Alamagan I.: near the old crater, up to 700 m, *Kanehira* 2182 (FU, type, not seen; K, P), fl. fr.; *ibid.*, *Hosokawa* 7913 (BISH), fl.

The species is apparently nearest to *Styphelia tameiameiae* from the Hawaii and Marquesas Isl.

Bull. 1, 9 (1897) 872.

var. *tameiameiae* from the Hawaiian Islands.

Cyathodes tameiameiae is based on a specimen collected by Eschscholtz (or may be by Eschscholtz & Chamisso) "in clivis aridioribus ad radices montium circa Hanaruru (i.e. Honolulu) insulae Oahu" (B, †; G-Boiss, K, L; LE, type, not seen; P). *S. tameiameiae* var. *hexamera* was collected on Oahu, Koolau Ra., on the main divide above Kaipapau

Gulch at 850 m, by Fosberg & Hosaka (13971, BISH). As to the leaves, this variety is intermediate between var. *tameiameiae* and var. *brownii*; 6- and 7-merous flowers occur occasionally both in *S. tameiameiae* and in *S. douglasii*, and cannot form the base of a proper variety. *Cyathodes macraeana* DC. was founded on a specimen collected by Macrae on "Owyhee" (i.e. on Hawaii) "ad montem ignivomem, Junio 1825", i.e. on Kilauea, preserved in G-DC, and is not distinguishable from typical *S. tameiameiae* in the form of the leaves ("foliis linearibus oblongis subobovatisque mucronatis" in the original description). In G-DC also the holotype of *Cyathodes banksii* Gaud. ex DC. is preserved, which hardly differs in the leaves from typical *S. tameiameiae*. *Cyathodes tameiameiae* var. *chamissoi* A. Gray f. *collina* Wawra is based on *Wawra* 1817 from Maui, Base of Haleakala, preserved in the Vienna Herb., and corresponds to var. *tameiameiae*. *Cyathodes imbricata* sensu Heller refers to Heller 2739 from a bog near the head of Wahiawa on Kauai, and equally is a form of var. *tameiameiae*, possibly slightly influenced by the above discussed "struthioloides" form of *S. douglasii* from practically the same place.

Var. *tameiameiae* is known from Hawaii, Oahu, Maui, Kauai, Lanai, and Molokai. I had the opportunity to study extensive and locally often rather homogeneous populations of *S. tameiameiae* on the 4 islands mentioned first, from sealevel (Mackenzie Park near Hilo, on Hawaii, Sleumer 4559) up to 2150 m (on E. slope of Mauna Kea, between Puuoo and Huikao, Sleumer 4558), and on various soils. There are many local forms (apart from the *douglasii*-influenced hybrids at medium altitudes), which cannot be treated as systematically clear-cut entities due to the numerous transitions in leaf shape and size, the length of the apical mucro, the size of the flowers (smallest ones but 3 mm long in all), and the colour of the fruits, besides a group of forms with larger and more elliptic leaves, chiefly found in the upper mountain forest and/or generally at higher altitudes, which can be united as var. *brownii*.

The species is gynodioecious. In the 'female' specimens the anthers are much reduced in size and without a trace of pollen; generally these shrubs are fruiting profusely. The corolla tube is rather short, and practically not exserted from the sepals. In the bisexual specimens, the corolla tube is mostly a little longer and consequently slightly exserted from the sepals. Such specimens flowered profusely during the time of my visit to Hawaii (February-March), and immature and mature fruits were but rarely found on them.

var. *tameiameiae* from the Marquesas Islands.

MARQUESAS ISL. Nukuhiva: Tovii, 900—950 m, rare, F. Brown 533 (BISH, type of *f. marquesensis*), 533A, 533B; Decker 379 (BISH); Quarle 1237 (BISH); Henry 41 (P). — Maauu: 900 m, Mumford & Adamson 560 (BISH); E. Tunoa Pahuhitone ridge, 975 m, Hambuechen 308 (BISH); no locality given: Henry 5 (P).

Having investigated these materials, I am unable to give any constant character to separate the Marquesas specimens from the Hawaiian forms as collected under var. *tameiameiae* above.

var. *brownii* (A. Gray) St. John, Occ. Pap. Bern. P. Bish. Mus. 17, 7 (1942) 84. — *Cyathodes tameiameiae* Cham. var. *brownii* A. Gray, Proc. Am. Ac. 5 (1862) 325. — *Cyathodes tameiameiae* Cham. var. *macraeana* (non DC. pr. sp. s. str.) Hillebr., Fl. Hawaiian Isl. (1888) 273. — *Cyathodes tameiameiae* Cham. var. *chamissoi* A. Gray f. *montana* Wawra, Flora 56 (1873) 59.

The type material of *Cyathodes tameiameiae* var. *brownii* in the Gray Herbarium consists of plants collected by the U.S. Expl. Exp. under Capt. Wilkes in 1838/42 and by Macrae in 1825 "on Maui, Kauai and especially Hawaii". In the original description var. *brownii*

is distinguished from the typical variety (A. Gray's var. *chamissoi*) by corolla lobes which are glabrous inside, a character which also occurs in var. *tameiameiae* (and in *S. douglasii*). Such forms with glabrous or almost glabrous corollas I found, to my surprise, on the 2 sheets designated by A. Gray himself as var. *chamissoi* in the Gray Herbarium; part of these have broad leaves, as specimens of the U.S. Expl. Exp. and Remy 488.

Under var. *brownii*, A. Gray cites "(*C. banksii* Gaud.?) & *C. Macraeana*, DC.)", but it is questionable, if var. *brownii* was a name in the varietal category for *Cyathodes macraeana* DC. and for the doubtful *C. banksii* Gaud. ex DC. If so — as St. John states —, the type of one of these species must be the type of var. *brownii*. I cannot follow St. John in such an argumentation and prefer to consider var. *brownii* as an independently described variety, the type of which must be chosen from the original material in the Asa Gray Herbarium. This material comprises 2 herbarium sheets, one with specimens with broad leaves from Kauai and Maui, collected by the U.S. Expl. Exp., and another with rather narrow-leaved specimens from Hawaii (leg. U.S. Expl. Exp.) and one broad-leaved specimen from Hawaii (leg. *Macrae*).

The broad-leaved variety was named by Hillebrand var. *macraeana* (*Cyathodes macraeana* DC. and var. *brownii* A. Gray being cited by Hillebrand in synonymy). This varietal name *macraeana* is illegitimate, because the varietal name *brownii* is older. Indirectly, Hillebrand in this place enlarged the description of var. *brownii* with leaf characters. Unfortunately the type of *Cyathodes macraeana* DC. (and of *C. banksii* Gaud. ex DC.), conserved in the DeCandolle Herbarium at Geneva and seen by the present author, coincide, as to leaf-characters, with var. *tameiameiae*, the description of which hardly differs from those of *Cyathodes macraeana* and *C. banksii*, if a possibly present pubescence of the inner side of the corolla lobes is neglected.

Wawra has the broad-leaved variety under *f. montana*, collected by him (1661) near Waiolani, Oahu, and preserved in the Vienna Herbarium.

To save the situation both systematically and nomenclaturally, I have selected as *lectotype* of var. *brownii* the broad-leaved specimen from Maui (leg. U.S. Expl. Exp.) from the original material, which Asa Gray designated himself as such. This material is matched by Degener 18489 and Degener & Fleming 25308 from Koolau Gap, Haleakala, on Maui.

This broad-leaved variety is known from Hawaii, Maui, Kauai, Lanai, and Oahu.

2. DECATOCA

Type species: *T. laurina* (R. Br. ex Rudge) R. Br.

KEY TO THE SPECIES

1. Bracteoles 2, opposite. Flowers in spikes, racemes or at least 3-flowered clusters. Subgen. **Trochocarpa**.
 2. Leaves (2.5—)3—5(—7.5, rarely up to 8.5) by (0.5—)0.1—2.5(—2.7, rarely up to 3.5) cm, narrow-leaved juvenile microforms excepted. Spikes many-flowered, suberect, (1.5—)2—4(—5) cm. Pyrenes very close together, initially forming a deeply (8—)10-ribbed kind of stone, finally separable from each other. *Australia (New S. Wales, Queensland), NW. New Guinea*
 1. *T. laurina* (R. Br. ex Rudge) R. Br.
 2. Leaves up to 1.8 by 0.6 cm. Flowers condensed into few-flowered, very short spikes or spike-like, ± recurved clusters. Pyrenes close together, from the beginning separated by a conspicuous layer of pulpy mesocarp, easily separable from each other later on.
 3. Main nerves on the undersurface of the leaves few and spaced, sometimes obsolete, whether or not branched, more distinct than their branches.
 4. Corolla quite glabrous inside. (Nervation of the leaves of the type found in *T. disticha*, but generally less raised, or even obscure.) *Tasmania* *T. gunnii* (Hook. f.) Benth.
 4. Corolla laxly to densely hairy inside on the lobes and/or the upper part of the tube.
 5. All main nerves of the leaves provided with numerous short branches on either side and ± from below, ± distinctly raised especially on the upper surface, as is the branching. *Tasmania*. *T. disticha* (Lab.) Spr.
 5. Lateral nerves of the leaves unbranched or branched outward only, the branching in general sparse and mainly in the upper part of the leaves; nerves incl. their branching impressed or obscure, never raised above.
 6. Petiole very slender, equalling $\frac{1}{2}$ to almost $\frac{1}{2}$ the length of the blade. *Tasmania*.
 6. Petiole slender to stoutish, (much) shorter than $\frac{1}{2}$ the length of the blade.
 7. Leaves lanceolate-acicular, 0.5—1 (rarely in the same specimen partly up to 1.5) mm wide. Fruit pink to light purple at full maturity. (Branchlets covered with a subvillous yellowish tomentum; when patently short-hairy or puberulous, cf. *T. decockii*.) *NW. New Guinea*. *2. T. gjellerupii* (J.J.S.) H. J. Lam
 7. Leaves lanceolate, oblong to ovate, on an average (much) wider, microforms excepted. Fruit blue-purple to almost blackish at full maturity.
 8. Corolla 5-partite ± halfway, the tube ± equaling the sepals and therefore generally ± included by them. *N. Borneo, Central Celebes* *3. T. celebica* (J.J.S.) Steen.
 8. Corolla 5-lobed to ± $\frac{1}{2}$ (or less), the tube decidedly longer than the sepals and therefore exserted from them.
 9. Uppermost part of the corolla tube inside with a tuft of longish, rather coarse hairs. Corolla campanulate, greenish, lobes purplish. *Australia (Victoria)*.
 9. Uppermost part of the corolla tube inside laxly to subdensely set with fine, rather short hairs. Corolla suburceolate-cylindric, creamy-white, white or pink. *New Guinea*. *4. T. decockii* (J.J.S.) H. J. Lam
 3. Main nerves on the undersurface of the leaves rather numerous and close together, always distinct, much fan-like branched, not very different in appearance from their branches.
 10. Corolla ± campanulate, 5-partite ± halfway, with many prominent, longitudinal veins outside. *New Guinea* *5. T. nutans* (J.J.S.) H. J. Lam
 10. Corolla urceolate-cylindric, 5-lobed to ± $\frac{1}{2}$, not veined at all.
 11. Corolla 4—5 mm long, lobes included. Leaves lanceolate to lanceolate-oblong; nerves hardly prominent, or a little sunk on both faces or underneath only. *New Guinea*.
 11. Corolla 5—6(—6.5) mm long, lobes included. Leaves ovate to elliptic-ovate or ovate-oblong; nerves ± strongly prominent on both faces. *New Guinea*
 7. *T. dispersa* Sleum.
 1. Bracteoles numerous (7—10). Flowers solitary, or rarely in twos. Subgen. **Pseudocyathodes**.

12. Branchlets very densely leaved, practically glabrous. Leaves lanceolate or narrow-lanceolate, (6—) 8—10 by 1—1.5(—2) mm; petiole c. 0.5 mm. *NW. New Guinea.*

8. *T. arfakensis* (Kaneh. & Hatus.) Sleum.

12. Branchlets less densely leaved, ± densely patently puberulous to hirsutulous. Leaves lanceolate to oblong-lanceolate, 8—10 by 2.5—3.5 mm; petiole 1(—1.5) mm. *New Guinea.*

9. *T. papuana* (C. H. Wright) Sleum.

NEW GUINEA. Northwestern part: Tamrau Mts East, waterdivide above Waumi R. camp, Wamsuf massif, 2000 m, *van Royen & Sleumer 7230*; Nettoti Mts, S. slope and crest of Mt Nettoti, 1850—2100 m, *van Royen & Sleumer 7450, 7977, 8066*; Arfak Mts, Anggi Lakes, 2285—2300 m, *Gibbs 5631* (BM, type of *Styphelia nutans* var. *arfakensis*); *Kanehira & Hatusima 13977*; Mt Koébré ridge between Anggi Lakes,

2300—2350 m, Sleumer & Vink 4273, 4282; *ibid.*, NE. part, 2430 m, Sleumer & Vink 4478; Mt Gwamongga above Surerei, Anggi Gigi Lake, 2550 m (top), Sleumer & Vink 4373; Mt Mundi, c. 1900 m (top), BW 2250 Mangold. — Southwestern part: Utakwa R. to Mt Carstensz, 2530—3350 m, B. Kloss s.n. (BM, type of *Styphelia carstensis*); Hellwig Mts, top c. 2600 m, Pulle 590; von Römer 1319 (BO, lectotype of *Styphelia nutans* = t. 145); van Nouhuys s.n. (BO, syntype of *Styphelia nutans*); Wichmann Mts, top, c. 3000 m, Pulle 974.

6. *Trochocarpa nubicola* (Wernh.) Sleum., nov. comb. — *Styphelia nubicola* Wernh., Trans. Linn. Soc. ser. 2 Bot. 9 (1916) 101.

NEW GUINEA. Western part: Utakwa R. to Mt Carstensz, 2530—3810 m, B. Kloss s.n. (BM, type); Mt Wilhelmina, 3400—3800 m, Brass & Meijer Drees 9640, 9665, 9910, 10341; Lake Habbema, 3000—3225 m, Brass 9063, 9096, 9101, 9574, 10663. — Southeastern part: Mt Scratchley, 3050—3960 m, Giulianetti anno 1896 (K, part of the material on the type sheet of *Leucopogon papuanus* C. H. Wright).

7. *Trochocarpa dispersa* Sleum., nov. spec.—Frutex 0.3—1.5(—2.5) m altus, ramis numerosis iterum ramosis suberectis. Ramuli graciles (c. 1 mm diam.), subdense patenter pilosi vel subhirsutuli, dense foliati. Folia subpatentia, ovata vel elliptico-ovata, rarius ovato-oblonga, apice sensim subacuminata-attenuata, basi rotundata usque late cuneata, ± caduce subserrulato-ciliolata, ceterum glabra, supra lucida, subtus pallidiora et opaca, 7—9(—13) mm longa, (3—)4—5 (raro usque ad 6) mm lata, nervis primariis numerosis, densis, iterum et iterum cincinnato-ramosis, subtus cum ramulis ± aequaliter bene prominentibus, supra (ramificationibus inclusis) minus elevatis; petioli c. 1 mm longi. Racemi abbreviati, recurvati, terminales et ex axillis superioribus nonnullis orti, (3—)4—8(—10)-flori; rhachis brevissima, dense pilis brevibus induita, inferne bracteis nonnullis obtecta. Flores (sub)sessiles, bractea basali ovata, c. 1 mm longa, bracteolis 2 suboppositis, ovatis c. 1.5 mm longis. Sepala oblongo-ovata, 2—2.5 mm longa, sicut bracteae bracteolaeque carinata, ciliolata, dorso glabra et prominulo-venosa. Corolla alba, urceolato-cylindrica, tota 5—6(—6.5) mm longa, intus in superiore $\frac{1}{3}$ tubi subdense pilis longis retrorsis induita, ceterum glabra, laevis, lobis ovato-oblongis, obtusis, 1.5—1.8 mm longis, parum patentibus. Antherae in fl. ♂ 1.2 mm longae. Discus cupularis, leviter 5—10-lobus. Ovarium subglobosum, glabrum, stylo crasso 1.5—2 mm longo, stigmate peltato. Fructus depresso-globosus, in vivo pallide caeruleus vel purpurascens, maturitate 3—4 mm longus, 5—6 diam., stylo haud accrescenti coronatus.

NEW GUINEA. Eastern Highlands: Mt Wilhelm, East slopes around the Lakes, 3400—3600 m, fl. fr. 13/15-9-1961, Sleumer 4147, 4177 (A; L, type; LAE), in fores; Brass 30145; NGF 14681 Millar. — Western Highlands: Wahgi Divide, NGF 5197 Womersley (K, LAE); Minj Subdistr., Central Kubor Ra., Mt Kinkain, 3400—3600 m, Pullen 216 (CANB); Saunders 731 (CANB, LAE).

subg. PSEUDOCYATHODES

Sleum., subgen. nov.—Flores solitarii, rarius bini, sessiles. Bracteolae numerosae (7—10). Ovarium (8—)10-loculare. *Bacca* carnosa, pyrenas (8—)10 distinctas (pulpa separatas) continens.

Type species: *T. arfakensis* (Kaneh. & Hatus.) Sleum. = *Styphelia arfakensis* Kaneh. & Hatus.

8. *Trochocarpa arfakensis* (Kaneh. & Hatus.) Sleum., comb. nov. — *Styphelia arfakensis* Kaneh. & Hatus., Bot. Mag. Tokyo 56 (1942) 483, f. 6.

NEW GUINEA. Northwestern part: Arfak Mts, Anggi Lakes, 2100—2300 m, Kanehira & Hatusima 14042 (A, BO; FU, type of *S. arfakensis*, not seen); Mt Mesenuk, Anggi Gita Lake, 2150 m, Sleumer & Vink 4225; Mt Sensenemés above Surerei, Anggi Gigi Lake, 2400(—2600) m, Sleumer & Vink 4302; above Ikeremot village, 2050 m, Sleumer & Vink 4391; between 'Noordpool' and Inggris, BW 2058 Stefels; Mt Mundi, c. 1900 m, BW 2255 Mangold.

9. *Trochocarpa papuana* (C. H. Wright) Sleum., comb. nov. — *Leucopogon papuanus* C. H. Wright, Kew Bull. (1899) 104. — *Styphelia papuana* (C. H. Wright) Koord., Rec. Trav. Bot. Néerl. 7 (1910) 65, in text; J. J. S., Ic. Bog. 4, 1 (Nov. 1910) 82; *ibid.* (1913) 172, in text; Nova Guinea 8, 4 (1912) 798; Koord., Exk. Fl. Java 3 (1912) 22, in obs. — *Styphelia lamii* J. J. S., Nova Guinea 18 (1936) 123, t. 33, f. 1. — *T. lamii* (J. J. S.) H. J. Lam, Blumea 5 (1945) 574.

NEW GUINEA. Northern part: Mt Doorman, 3200 m, *Lam* 1802 (BO, type of *Styphelia lamii*; L). — Western Highlands: Mt Hagen, 3350 m, Robbins 295; Wahgi-Jimmi Div., 3170 m, NCF 5301 Womersley. — Morobe Distr.: Mt Saruwaged, 2750 m, *Clemens* 5590, 5846; *ibid.*, Ulap Trail, *Clemens* 41145 (A); *ibid.*, Yaneng R., 1525—1830 m, *Clemens* 12304 (A); *ibid.*, Samanzing vicinity, 2440—3050 m, *Clemens* 9848 (A), 9893 (A). — Central Distr.: Mt Albert Edward, 3680 m, Brass 4424; Mt Scratchley, 3050—3960 m, Giulianetti anno 1896 (K, type of *Leucopogon papuanus*).

DOUBTFUL SPECIES

***Trochocarpa parviflora* (Stschegl.) Benth., Fl. Austr. 4 (1869) 167. — *Decaspora parviflora* Stschegl., Bull. Soc. Nat. Moscou 32 (1859) i, 10.**

AUSTRALIA. Western part: Swan R.: *Drummond* 157 (BM, G-Boiss, K, L), fl. immat., fr. mat.

This species was described with flowers in an early bud stage and with ripe fruits. The aspect of the inflorescences and leaves are, as Bentham already stated, almost those of some forms of the widely distributed *Acrotriche cordata* (Lab.) R. Br., which, however, has a (4—)5-celled ovary and a smooth fruit with 5 pyrenes, these ± united into a central, rather hard stone. Other species of *Acrotriche* (revised by Paterson, Proc. Linn. Soc. New S. Wales 85, 1960, 75—93) show up to 10 and much less compactly coherent pyrenes, which may protrude with as many prominent ribs, covered by a rather scanty dry mesocarp.

In *Trochocarpa parviflora* the 10 pyrenes are separated from each other by a very thin layer of the mesocarp, which is equally thin (and probably pale in colour) all around the fruit, and thus allows to protrude the outer edge of the pyrenes in form of 10 distinct ribs by its desiccation. In all other species of the genus the pulp of the fruit is much more rich both between the pyrenes and around them, and the pyrenes themselves are less hard and faintly or not prominent at all.

The generic status of *Trochocarpa parviflora* depends on the knowledge of the fully developed flower, which is not yet known up till now as the species has not been re-collected. It looks, however, justified, to remove this Western Australian species — which might belong to *Acrotriche* R. Br. — from the genus *Trochocarpa* R. Br., which genus is only known from North Borneo, Central Celebes, New Guinea, and the eastern part of Australia (*incl.* Tasmania).

EXCLUDED SPECIES

Trochocarpa ericaefolia (Hook. f.) F. v. M. = *Pentachondra ericaefolia* Hook. f.

Trochocarpa glauca (Lab.) Spr. = *Styphelia billardieri* F. v. M. (= *Cyathodes glauca* Lab.).

Trochocarpa involucrata (R. Br.) F. v. M. = *Pentachondra involucrata* R. Br.

Trochocarpa novae-zelandiae Colenso = *Pentachondra pumila* (J. R. & G. Forst.) R. Br.

Trochocarpa pumila (Forst.) F. v. M. = *Pentachondra pumila* (J. R. & G. Forst.) R. Br. (= *Epacris pumila* J. R. & G. Forst.).

Trochocarpa verticillata (Hook. f.) F. v. M. = *Pentachondra?* *verticillata* Hook. f.

APPENDIX

Monotoca elliptica (Sm.) R. Br., Prod. (1810) 546. — *Lissanthe mucronata* DC., Prod. 7 (1839) 743; Benth., Fl. Austr. 4 (1869) 176, *syn. nov.*

I have examined the holotype specimen of *Lissanthe mucronata* in the De Candolle Herbarium at Geneva.

EXCLUDED GENUS

Nautophylla Guillaumin, Mém. Mus. Hist. Nat. Paris, n.s., sér. B, Bot. 4, 1 (1953) 44, fig. 13, which was described as a monotypic genus of *Epacridaceae* from New Caledonia, has been reduced to the genus *Logania* (*Loganiaceae*) by Leenhouts & Van Steenis, Bull. Jard. Bot. Brux. 32 (1962) 439—440.
