

A TAXONOMIC REVISION OF THE GENUS SCOTTELLIA OLIV. (FLACOURTIACEAE)

H. SLEUMER
Rijksherbarium, Leiden

SUMMARY

The author presents a taxonomic revision of the genus *Scottellia* on the basis of the materials found in the herbaria most important for tropical Africa. The 15 taxa described previously were reduced to 3 species (with 1 variety), whilst 1 species had to be excluded from the genus.

In the course of his revision of the *Flacourtiaceae* of Africa the author had also to deal with the small genus *Scottellia* which is found mainly in the western part of tropical Africa (Fig. 1). The genus has been treated previously in part in local floras, but has never been revised as a whole since its publication by Oliver about 80 years ago. The present revision is based on a MS. elaborated at Berlin-Dahlem in 1936, i.e. before the destruction of the Berlin herbarium, and furthermore on the collections recently seen from the following herbaria: Berlin (B, after 1943), Bruxelles (BR), Hamburg (HBG), Kew (K), Leiden (L), London (BM), Munich (M), Oxford (FHO), Paris (P), Wageningen (WAG), and Zürich (Z). The author wishes to express his sincerest thanks to the directors and colleagues of these institutions; his work has been subsidized by the Netherlands Foundation for the Advancement of Tropical Research (WOTRO) at The Hague.

The apparent high variability in *Scottellia* was originally the reason for the description of 15 species; there is an increasing uncertainty in naming the numerous recent collections. With herbarium specimens alone it is difficult to evaluate the importance, i.e. constancy, of characters usually applied in the genus for the delimitation of its species. Fortunately, Tisserant & Sillans (1953) have published their field observations on the variability of *Scottellia* in the Oubangi-Chari area. They found 'un manque de constance' in foliar characters (form, size, texture, and dentation of leaves). As to floral characters, only small differences in the form, size, and degree of hairiness of the scales at the inner side of the petals are mentioned. A certain constancy is stated for fruit characters, i.e. size of the fruit and the number of its seeds.

If fruit characters are used, then *Scottellia orientalis* can be well distinguished from *S. leonensis* and *S. klaineana*. *S. leonensis* can be separated from *S. klaineana* less reliably by certain leaf-characters (size of lamina, shorter and thicker petioles) and a generally more stoutish rhachis. The remaining *S. klaineana*-complex can be divided still less clearly on the basis of ± overlapping leaf and flower characters into 2 taxa at the level of mere varieties, as done before by Pellegrin (1953). Each of these comprises a number of morphologically much intergrading forms to which no taxonomically satisfactory status can be given. Their ecological range, according to the scanty notes on herbarium labels, comprises swamp forest, rain forest, gallery forest, and forest edges with savannahs. It is not yet clear, whether these forms are geographical, i.e. locally constant races, or represent eco-types bound to similar ecological niches.

SCOTTELLIA

Congo, Rwanda & Burundi, Sperm. Flacourt. pt. 1 (1968) 9. — Type: *S. leonensis* Oliv.

[*Dasypetalum* Pierre ex Cheval., Vég. Ut. Afr. Tr. Fr. 9 (1917) 55, in syn. *Scottellia*.]

Shrubs or trees. Leaves persistent, alternate, entire or with shallow teeth, pinninerved, glabrous, often finely tuberculate on both faces; petiole thickened at both ends; stipules none. Inflorescences axillary or subterminal, consisting of 1 or mostly of several racemes, these arranged to pseudopanicles or umbel-like fascicles; pedicels from several minute, ± caducous, subtriangular bracts. Flowers bisexual, or polygamous-monoecious, i.e. partly in the same raceme (generally the lower ones) ♂ only, white or cream, often strongly scented. Sepals (4 or) 5, free, imbricate, subequal, suborbicular, thin. Petals 5, imbricate, similar in size to the sepals but often thinner (membranous) and more distinctly veined, each provided at the base inside with a free or basally adherent, scale-like, hairy appendage. Stamens 5, alternating with the petals; filaments linear-subulate, glabrous, about twice as long as the anthers, these ovate-elliptic, bifid or subcordate at the base, basifixied, longitudinally dehiscent, the connective enlarged. Ovary free, much attenuate at the base to shortly stipitate, unilocular, with 3 parietal multiovulate placentas, attenuate to short trifid style. Capsule splitting into 3 finally ± reflexed valves; pericarp coriaceous to almost woody, pustular or verruculose outside, smooth or wrinkled inside; seeds 1—3 (rarely up to 10), subglobular or inequally obtusely angular, smooth, glabrous, covered by a thin bright red or orange-red aril; testa coriaceous; endosperm copious, fleshy; cotyledons foliaceous; radicula straight.

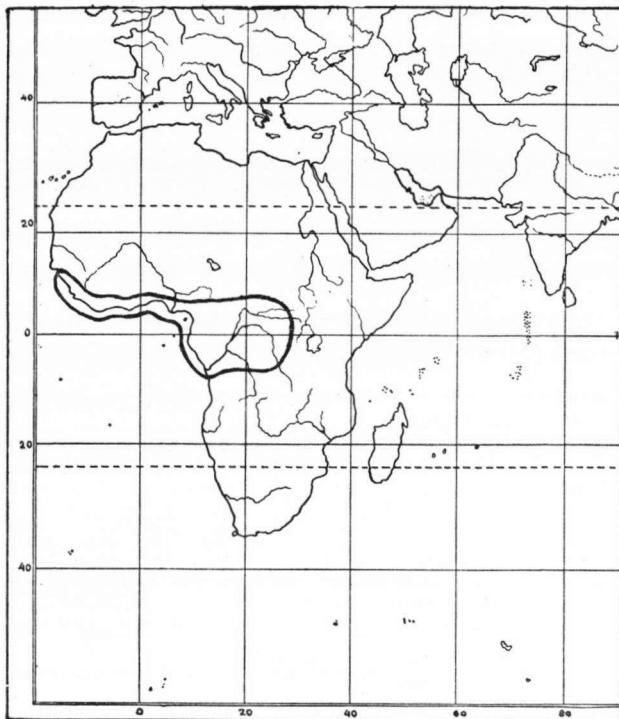

A genus of 3 species in (mainly western) tropical Africa (see Map).

E c o l o g y. Understorey tree or shrub in rain forest, sometimes locally dominant, also in riverine or gallery forest, swamp forest, and forest edges with savannahs.

U s e s. The wood of *Scottellia klaineana* is said to be hard, but is used mainly locally. See Kribs, For. Woods Amer. Market (1950) 75 f. 136; Lebacq & Dechamps, Contr. Invent. For. Nord-Kasai (1967) 372.

KEY TO THE SPECIES

1. Fruit in the dry state (10—)12—15(—18) mm in diam.; pericarp thick (1—1.5 mm), almost woody; seeds generally 3—5(—10). (Leaves coriaceous, 7—19(—21) by 4—9(—12) cm. Racemes stoutish, 8—16 cm). *S. Nigeria*, *S. Sudan*, *Centrafrican Rep.*, *Zaire* (*Bas-Katanga*, *Centr. For. Distr.*, *Ubangi-Uele*)
I. S. orientalis
1. Fruit (3—)4—8 (very rarely up to 9) mm in diam.; pericarp thin (0.5—1 mm), ± coriaceous; seeds generally 1 or 2 (rarely 3).
 2. Leaves rigidly coriaceous, base rounded to subcordate, 8—21 by 5—12 cm; petiole 4—7 by 1.5—2 mm. Racemes rather stoutish. *Port. Guinea*, *Guinée*, *Sierra Leone*, *Liberia* 2. *S. leonensis*
 2. Leaves subcoriaceous to coriaceous, ± flexible, base rounded to cuneate; petiole in general more slender. Racemes slender.
 3. Leaves 5—10(—12) by 3—5 (rarely —6) cm. Sepals with rather obscure longitudinal nerves. *Sierra Leone*, *Liberia*, *Côte d'Ivoire*, *Ghana*, *Nigeria*, *Cameroon*, *Equat. Guinea*, *Centrafrican Rep.*,

Afr. ed. 2, 1 (1954) 186 p.p. (syntype excl.).

Tree (10—)15—40 m, trunk 30—100 cm in diam., fluted. Branchlets terete, brownish, practically glabrous, lenticels sparse. Leaves oblong to obovate-elliptic, rarely subovate-oblong, apex rather abruptly and obtusely acuminate, base broadly cuneate to rounded,

coriaceous, shining, entire or remotely undulate-crenate to -subserrate, 7—19(—21) by 4—9(—12) cm, nerves 6—8 pairs, slightly raised above, markedly so beneath, reticulation more obvious above than beneath; petiole 1—2(—2.5) cm. *Racemes* solitary, spreading from the upper 1—4 axils (these very close together, and the upper 1 or 2 ones leafless), forming together an abbreviated, almost umbel-like panicle, puberulent or glabrous in all outer parts; rhachis slender (*c.* 1 mm across), 8—16 cm; pedicels slender, 5—10 mm in anthesis, up to 15 mm in fruit. *Sepals* suborbicular-obovate, ciliolate, 3—4 by 2—3 mm. *Petals* obovate, ciliolate, 4—5 by 2 mm, the basal inner densely hairy appendage 1—1.5 mm. *Anthers* 2 mm. *Ovary* 5-costulate, glabrous or with rather sparse hairs; style 0.5 mm. *Fruit* subglobular, (10—)12—15(—18) mm in diam., glabrous, valves much spreading; pericarp 1—1.5 mm thick, ± ligneous, finely verrucose outside, smooth and lustrous with much elevated placentas and several transverse elevated lines inside. *Seeds* (1—)3—5 (—10), subglobular-angular, 5—6 mm in diam.

EcoLOGY. Mainly in riverine and swamp forest, also in gallery forest, generally at low altitudes, rarely up to 1000 m.

Note. Similar in leaf-texture to certain forms of *S. klaineana* var. *klaineana* which are difficult to distinguish from *S. orientalis* by leaf and flower characters alone; this is especially the case in Nigeria (Benin: Jamieson R. area) where both species occur, as may be concluded from fruiting specimens.

2. *Scotellia leonensis* Oliv. in Hook., Ic. Pl. 23 (1893) t. 2265; Dur. & Schinz, Consp. Fl. Afr. 1 (1898) 225; Pierre, Bull. Soc. Linn. Paris, n.s., n. 14 (1899) 113; Gilg, Bot. Jahrb. 40 (1908) 445; Engl., Pflanzenw. Afr. 3, 2 (1921) 561; Gilg in E. & P., Nat. Pflfam., ed. 2, 21 (1925) 394; Hutch. & Dalz., Fl. W. Tr. Tree, 5—20(—30) m, trunk up to 70 cm in diam., straight, slightly fluted; bark thin, smooth or pustular, greenish-grey to blackish. Branchlets glabrous, older parts early corticate and lenticellate. Leaves oblong to obovate-oblong, or elliptic, rarely subovate, rather variable in shape and size, apex for 0.5—1.2 cm obtusely and ± abruptly acuminate,

rarely attenuate-obtuse or rounded, base generally ± broadly cuneate, sometimes obtuse or rounded, rarely subcordate, subcoriaceous to coriaceous, glabrous, entire or shallowly subserrate-crenate, 5—10(—12) by 3—5(—6) cm, nerves 6—8 pairs, ± obsolete above, slightly prominent beneath, reticulation rather coarse, slightly raised beneath; petiole 4—12(—20) by ± 1 mm. *Racemes* one or few in a fascicle from the upper 1—3, sometimes partly defoliate axils, forming a subumbellate pseudopanicle or thyrsus; rhachis slender, glabrous or generally puberulous, 4—10 cm; pedicels slender to subfiliform, glabrous or mostly puberulous, at anthesis 3—5(—8) mm, in fruit a little accrescent and more stoutish. *Sepals* suborbicular-elliptic, veins obscure, dorsally glabrous, ciliate, 3(—4) by 2 mm. *Petals* oblong-obovate, long-ciliate, otherwise glabrous, (4—)5 by 2 mm, the basal hairy appendage 1—1.5 mm. *Anthers* 1.5—2 mm. *Ovary* substipitate, smooth, glabrous; style 0.5 mm, the 3 stigmatic branches ± reflexed (1 mm). *Capsule* subglobular, finely warty outside, ± smooth inside if not crumpled in the dry state, (3—)4—8(—9) mm in diam. in the dry state; pericarp coriaceous, 0.5—1 mm. *Seeds* 1 or 2 (or 3), inequally subglobose-angular 5—6 mm across.

ANGOLA. Cuanza Norte, Quitombe, Camabatela, Gossweiler 7396 (BM, type of *S. gossweileri*; COI, LISJC & LISU, n.v.).

E c o l o g y. Understorey tree in rain forest, locally abundant or even dominant, rarely in swamp forest, occasionally in semideciduous forest with *Celtis* and *Sterculia*.

N o t e. Sterile or flowering specimens with fully mature, i.e. ± coriaceous leaves are sometimes difficult to distinguish from those of *S. orientalis*.

var. *mimfiensis* (Gilg) Pellegrin, Mém. Soc. Bot. Fr. 1952 (1953) 108 p.p., *typo incl.* — *S. mimfiensis* Gilg, Bot. Jahrb. 40 (1908) 448; Engl., Pflanzenw. Afr. 3, 2 (1921) 561; Gilg in E. & P., Nat. Pflfam. ed. 2, 21 (1925) 394; Keay in Hutch. & Dalz., Fl. W. Tr. Afr. ed. 2, 1 (1954) 186; Keay, Onochie & Stanfield, Niger. Tr. 1 (1964) 98. — *S. chevalieri* Chipp, Kew Bull. (1923) 265; Gilg in E. & P., Nat. Pflfam. ed. 2, 21 (1925) 394; Hutch. & Dalz., Fl. W. Tr. Afr. ed. 1, 1 (1927) 160; Kennedy, For Fl. S. Niger. (1936) 30; Aubrév., Fl. For. Côte d'Ivoire 3 (1936) 6, t. 245 1—2; Keay in Hutch. & Dalz., Fl. W. Tr. Afr. ed. 2, 1 (1954) 186; Irvine, Woody Pl. Ghana (1961) 81. — *S. kamerunensis* auct., non Gilg: Cheval., Vég. Ut. Afr. Trop. Fr. 9 (1917) 60.

Leaves larger in general, (10—)12—16 by 6—9 cm. Sepals with more distinct (in dry specimens darker) longitudinal nerves. Connected by transitions with var. *klaineana*, and perhaps also with *S. orientalis* in Nigeria.

SIERRA LEONE. Kambui, Wallace 98 (FHO, sterile).

CÔTE D'IVOIRE. Rasso, Aubréville 143, 143 bis. Aonabo, route d'Abengourou, Aubréville 641. La Mé R., near bridge on road to Alépé, 0—50 m, Leeuwenberg 4157 (WAG). Sassandra Port, Chevalier 17920. Vallée d'Agniéby, Kapiécrou, fl., Chevalier 16182 (K, type of *S. chevalieri*; L, P).

GHANA. Pamu, Berekum For. Res., 300 m, Vigne 2502 (FHO, sterile). Tafo, Darko 156. Ntakem, Vigne 183 (FHO). Jimira For. Res., Vigne 3012 (FHO). Nswam, Dade 1001 (FHO).

NIGERIA. Ishan, Ebai R., FHI 38076 Olorunfemi (FHO, sterile). Oyo, Ife For. Res., FHI 41522 Olorunfemi. Ijebu, Omo & Shasha For. Res., FHI 15394 & 15396 Jones & Onochie, 16962 Jones & Onochie, 17226 Jones, Richards 3431 & 3432. Benin, Okomo For. Res., Brenan & Jones 8909, Ross 161; Sapoba, Jamieson R., Brenan 8937, FHI 21506 Keay & Onochie, 24689 Keay, Meikle 526 (fl., → *S. orientalis*?), Ross 235.

CAMEROON. Kumba, FHI 14020 Ejiosor. Kribi, Bipindi, 'am Ostabhang des Mimfia gegen das Lokundjetal' Zenker 3052 (B, lectotype of *S. mimfiensis*, †; BR, GOET, HBG, M, P, W, WU, Z); Nkuambo, Zenker 3064 (B, syntype of *S. mimfiensis*, †; GOET, HBG, L, M, P, W, WU, Z). Au S. de Mboy, 45 km à l'E. de Yokadouma, Letouzey 5057 (P, sterile). Entre Goyoum et Lindji, Dendeng, Letouzey 3280.

ZAIRE. Bas-Zaire. Seke Banza, park de la Fuka, Wagemanns 1911 (BR, sterile), 2184 (BR, fr.).
ANGOLA. Cabinda. Belize, Gossweiler 6970 (BM). Malange. Quela, von Nolde 432 (BM).

E c o l o g y. Apparently not different from that of var. *klaineana*.
