

THE GENUS CONANDRIUM MEZ (MYRSINACEAE)

H. SLEUMER

Rijksherbarium, Leiden, The Netherlands

SUMMARY

A taxonomic revision of the genus *Conandrium* Mez, which is reduced to 2 species, one in the Moluccas and in the extreme West of New Guinea, the other widely distributed all over New Guinea and the Bismarck Archipelago, and apparently also represented in the Aru Islands. A key to the species, complete descriptions and an enumeration of the collections studied are given.

INTRODUCTION

The genus *Conandrium* was described by Mez in his Monograph of the Myrsinaceae (1902), based on two species which had been considered before to belong to *Ardisia* Sw., i.e. *C. rhynchocarpum* from Amboina, and *C. polyanthum* from the Madang District in New Guinea. In fact only one character, the coherence of the anthers, distinguishes *Conandrium* from *Ardisia* with its free anthers; the limitation of this character to Eastern Malesia within the enormous distributional area of *Ardisia* gives some weight to such a distinction on the generic level.

A number of new species has been added more recently to *Conandrium* mainly by Mez himself, all from New Guinea. They are considered by the present author to represent forms of *C. polyanthum* without taxonomic value. The wide range of this species in New Guinea and the Bismarck Archipelago is now apparent. Specimens cited are preserved at L, if not stated otherwise.

CONANDRIUM

Conandrium Mez, Pflanzenr. 9 (1902) 156. – *Amblyanthus* A.DC. sect. *Conandrium* K.Schum., Fl. Deutsch. Schutzgeb. Südsee (1900) 492, in adnot. – Type: *C. polyanthum* (Laut. & K.Schum.) Mez.

KEY TO THE SPECIES

- 1a. Inflorescence finely rufous-papillose. Drupe apiculate by the remnant style base
 1. *C. rhynchocarpum*
- b. Inflorescence glabrous. Drupe depressed-globose, flattened at the top
 2. *C. polyanthum*

1. *Conandrium rhynchocarpum* (Scheff.) Mez

Conandrium rhynchocarpum (Scheff.) Mez, Pflanzenr. 9 (1902) 156; Merr., Philipp. J. Sci. 11 (1916) Bot. 302. — *Ardisia rhynchocarpa* Scheff., Myrsin. Arch. Ind. (1867) 68. — T y p e : A. Zippelius s.n. anno 1828, fr., Moluccas, Amboina (L.).

Shrub or treelet, 0.5–1.5(–4) m tall. Branchlets slightly compressed at tips, base thickened, glabrous. *Leaves* lanceolate to oblanceolate or sometimes lanceolate-elliptic, apex gradually attenuate to subacuminate, tip subacute or obtuse, base more or less elongately cuneate, chartaceous to subcoriaceous, brown when dry, with scattered thickish glandular points on both faces, edge subundulate or entire, (17–)26–30(–40) by (4.5–)7(–10) cm, midrib robust, impressed above, prominent beneath, or rather flat in dry specimens, lateral nerves 15 or more pairs, moderately curved-ascending, excurrent along the edge, slightly raised mainly beneath, reticulation of veins and veinlets dense, a little prominent on both faces; petiole robust, subalate, 0.5(–1) by c. 0.3 cm. *Racemes* solitary, simple, from the uppermost 1 or 2 (rarely more) axils, many-flowered, the flowers crowded in the upper part of the rachis, 15–23 cm; pedicels clavately thickened distally, fuscous-papillate all over, 0.5–1 cm; bracts green, caducous. *Flowers* 5-merous, pink to red-purple. *Calyx lobes* ovate, obtuse, glandular-punctate, ciliate, 2.5 mm. *Corolla lobes* ovate, glandular-punctate, ciliolate, 3–4(–6) mm. *Ovary* narrowly ovoid, attenuate to a short style; stigma punctate. *Drupe* subglobose-ellipsoid, apiculate by the slightly protracted remnant style base, c. 7 by 5 mm in dry specimens, on pedicel 1–2 cm.

D i s t r i b u t i o n . Moluccas and the extreme West of New Guinea.

E c o l o g y . In primary forest, from sea-level to c. 600 m.

N o t e . The determination of the New Guinea specimen remains somewhat uncertain, as flowers are missing.

MOLUCCAS. Sula Is., Mangole, Vesuvian Bay, Bloembergen 4794; Sulabesi, Kabauw, Bloembergen 4556. — Obi, Anggai, G. Batu Putih, de Vogel 3978, 3989. — Buru, Kajeli, Teijsmann s.n. Wae Kose, Wae Nibe, fl. fr., Mogaia 5151. Waeha, fl., van Balgooy 4662. — Amboina, Dolleschal 332 (W, cit. Mez, n.v.), Robinson 1882. — Ceram, Central part, Kaniki, Kornassi (Exp. Ruttent) 1388. Eastern part, Mt Kilia, Buwalda 5658.

NEW GUINEA. Western part, Vogelkop Peninsula, Steenkool, road to Tambuni, km 1.5, fr. apiculate, 7 May 1954, van Royen 3555.

2. *Conandrium polyanthum* (Laut. & K. Schum.) Mez

Conandrium polyanthum (Laut. & K. Schum.) Mez, Pflanzenr. 9 (1902) 157, f. 25; K. Schum., Nachr. Fl. Deutsch. Schutzgeb. Südsee (1905) 343; Streiman, The plants of the Upper Watut watershed of Papua New Guinea (1983) 146. — *Amblyanthus polyantha* Laut. & K. Schum. in K. Schum., Fl. Deutsch. Schutzgeb. Südsee (1900) 491. — T y p e : C. Lauterbach 1224, New Guinea, Madang Dist., Constantinhafen (= S of Bogadjim), 30 m, fl. fr., 12 Dec. 1890 (WRSL-Lauterbach; B, lost; L, iso).

Amblyanthus polyantha Laut. & K. Schum. var. *minor* K. Schum., Fl. Deutsch. Schutzgeb. Südsee (1900) 491. — T y p e : G. Bamler II-13, New Guinea, Morobe Dist., Sattelberg, fl., 12 Dec. 1898 (B, lost; WRSL-Lauterbach, iso).

Ardisia speciosa auct., non Blume 1826; Warb., Bot. Jahrb. 18 (Dec. 1893) 204, based on *F. Hellwig* 181, 461 & 464 from Kelana & Butaueng near Finschhafen, all lost in B; K. Schum., Fl. Deutsch. Schutzgeb. Südsee (1900) 488.

- Conandrium gymnopus* K. Schum., Nachr. Fl. Deutsch. Schutzgeb. Südsee (1905) 344, ex descr. – T y p e : E. Nyman 151, New Guinea, Madang Dist., Stephansort (now Bogadjim), fl., Jan. 1899 (B, lost). No duplicate at S.
- Conandrium ledermannii* Mez, Bot. Arch. 1 (1922) 256, ex descr. – T y p e : C. Ledermann 11138, New Guinea, E. Sepik Dist., Hunsteinspitze (B, lost).
- Conandrium finisterrae* Mez, Bot. Arch. 2 (1922) 176. – T y p e : R. Schlechter 18055, cit. '19055', New Guinea, Madang Dist., Finisterre Ra., 900 m, fl., 22 July 1908 (B, lost; K, P, iso).
- Conandrium maius* Mez, Bot. Arch. 2 (1922) 175, ex descr. – T y p e : R. Schlechter 18425, New Guinea, Madang Dist., W. Finisterre Ra., Keneyia (= Ramu) R., gallery forest, fl., Sept./Nov. 1908 (B, lost).
- Conandrium multipunctatum* Mez, Bot. Arch. 2 (1922) 175. – T y p e : R. Schlechter 17163, New Guinea, Madang Dist., Kani Mts, fl. (B, lecto, lost; P, isolecto); R. Schlechter 17107, ibid., Ibo Mts, fl. (B, syn, lost); C. Ledermann 9761, New Guinea, E. Sepik Dist., April R., fl. (B, syn, lost; L, isosyn); C. Ledermann 10043, ibid., 'Lordberg', fl. (B, syn, lost; K, L, isosyn).
- Conandrium peekelii* Mez, Bot. Arch. 2 (1922) 175; Peekel, Fl. Bismarck Arch. (1984) 427, f 683. – T y p e : G. Peekel 845, New Ireland, Lemakot (Lamekot), fl. (B, lost). Matched by Peekel 52 from type area (BO, L).
- Conandrium forbesii* S. Moore, J. Bot. 61 (1923) Suppl. 29. – T y p e : H. O. Forbes 597, New Guinea, Central Dist., Mt Korkoko, Sogere area, anno 1885/86, fl. (BM; K, L, iso).
- ? *Ardisia conandroidea* Kaneh. & Hatus., Bot. Mag. Tokyo 57 (1943) 217, f. 3. – T y p e : R. Kanehira & S. Hatusima 12625, W. New Guinea, Geelvink Bay, Ayeryat (40 km inland from Nabire), fr., 8 March 1940 (FU, n.v.; A, iso).

Glabrous shrub or bushy tree with spreading branches, 1–6(–15) m tall; bark smooth, gray to brown. Branchlets thickened at very base, compressed in the youngest parts, terete in the older ones, finely striate, pale grayish brown in dry specimens. Leaves elliptic or generally elliptic-oblong, sometimes lanceolate-oblong, apex broadly attenuate, subacute or obtuse, base cuneately attenuate, rarely obtuse, firmly chartaceous to subcoriaceous, sometimes almost coriaceous, dark to medium green and shining when fresh, usually of a gray-olivaceous-brownish colour and dull on both faces when dry, glabrous, with a thickish gland within each areola of veinlets distinct on both faces, entire, 9–18(–22) by (2.5–)3–6(–8) cm, variable in size in the same specimen, midrib narrow, a little or hardly impressed above, prominent beneath, lateral nerves 15–20 (or more) pairs, with additional shorter ones between, all rather straight or moderately curved from the midrib, parallel to each other, more curved towards the edge, slightly though visibly raised on both faces, reticulation of veins and veinlets fine and dense, somewhat prominent (lens!) on both faces; petiole canaliculate, 8–12(–15) by 1.5–2 mm. Racemes and/or panicles solitary from the uppermost 3–5 axils of generally already fallen leaves, composed of slender spreading partial racemose inflorescences, forming together a squarrose and seemingly terminal large panicle, (4.5–)6–14(–22) cm, peduncled to 5 cm; rachis rather slender, often a little zigzag, glabrous, thickened at the very base, many-flowered; pedicels 5–8(–10) mm at anthesis. Flowers 5-merous, purplish red. Calyx lobes ovate-obtuse to orbicular, spreading or reflexed, greenish, ciliate and finely erose, thickly dark glandular-punctate, 1.2–1.5 mm. Corolla ovate in bud, lobed to almost the base at anthesis, lobes ovate-acuminate, manifestly ciliolate in their lower part, glandular-punctate, 2.5–3(–4) mm. Stamens connivent over the ovary; anthers connate at least in their lower half, 2–2.5 mm; filaments free,

broadly triangular, 0.8 mm. *Ovary* globular; style filiform, 1.5–2 mm. *Drupe* globose, a little depressed, densely glandular-punctate, purple red to blackish at maturity, 3.5–4.5(–5) mm in diameter when dry, reported to be 6–7(–10) mm when fresh, on stoutish pedicel to 15 mm long; exocarp thin, fleshy; endocarp thin, hard.

Distribution. All over New Guinea and the Bismarck Archipelago, apparently also in the Aru Is., but absent from the Solomon Is.

EcoLOGY. In coastal lowland to montane, also disturbed or secondary rain forest, often along bank of stream, occasionally in old gardens regrowth, swamp forest or closed savannah forest, from sea-level to 1400(–2195) m altitude.
