

THE COMPOSITAE OF NEW GUINEA III*)

JOSÉPHINE TH. KOSTER
Rijksherbarium, Leiden

4. INULEAE*)

Cass., J. Phys. Chim. Hist. Nat. 88 (1819) 193; Hoffmann, E. & P., Nat. Pl. Fam. 4, 5 (1894) 172.

Herbs. Leaves nearly always alternate, sometimes rosulate, mostly entire, sometimes dentate, rarely pinnatifid. Heads solitary or in inflorescences, homogamous or heterogamous; phyllaries one- to many-seriate, herbaceous or membranous; corolla of marginal flowers filiform, dentate, or ligulate, of disc flowers tubular, (4- or) 5-dentate; anthers sagittate and mostly caudate at the base; style two-armed; achene small, pappus setaceous, sometimes consisting of scales, or wanting; receptacle naked.

KEY TO THE GENERA IN NEW GUINEA

- 1 a. Leaves decurrent along the stem; heads small, densely clustered into glomerules 2
- b. Leaves not decurrent along the stem; heads solitary, few together, corymbose, paniculate, or clustered, but not in glomerules 3
- 2 a. Pappus setaceous 1. Pterocaulon
- b. Pappus wanting 2. Sphaeranthus
- 3 a. Heads small, numerous, disc-shaped; pappus wanting 3. Epaltes
- b. Heads variously shaped; pappus setaceous 4
- 4 a. Heads large; involucre 18—25 mm long; phyllaries orange-yellow, afterwards yellow-brown, glossy. 4. Helichrysum
 - b. Involucre much shorter than 18 mm; phyllaries variously coloured but not yellow 5
- 5 a. Heads solitary, homogamous; corolla tubular. 5. Phacellothrix
- b. Heads solitary or several together, mostly heterogamous, when homogamous then corolla of marginal flowers filiform 6
- 6 a. Whitish lanate herbs; phyllaries rigid, membranous, more or less glossy, whitish or light brown. 7
- b. Herbs not whitish lanate; phyllaries herbaceous or membranous, not whitish or light brown 8
- 7 a. Heads densely corymbose, shortly pedunculate; feminine marginal flowers often numerous, sometimes wanting; disc flowers often masculine, sometimes bisexual, 1—50; exclusively masculine heads frequent, number of marginal flowers and disc flowers in a head very variable in one and the same species. 6. Anaphalis
 - b. Heads clustered or solitary, sessile or subsessile; feminine marginal flowers numerous; disc flowers bisexual, 1—7; exclusively masculine heads not occurring, number of marginal flowers and disc flowers in a head not much variable in one and the same species 7. Gnaphalium
- 8 a. Disc flowers few, masculine; style undivided or shortly two-armed, ovary rudimentary 8. Pluchea
- b. Disc flowers few or numerous, bisexual; style arms fairly long, ovary normally developed 9. Blumea

*) I in Nova Guinea, Bot. 24 (1966) 497—614 (numbering of tribes in accordance with this paper); II in Blumea 18 (1970) 137—145.

I. PTEROCAULON

Elliot, Sketch Bot. S.-Carol. and Geo. 2 (1823) 323; Benth., Fl. Austr. 3 (1866) 522; Benth. & Hook. f., Gen. Pl. 2 (1873) 294; Clarke, Comp. Ind. (1876) 98; Hook. f., Fl. Br. Ind. 3 (1881) 275; Hoffmann, E. & P., Nat. Pl. Fam. 4, 5 (1894) 178; Koster in Backer & Bakh., Fl. Java 2 (1965) 391. — *Monenteles* Labill., Sert. Austro-caled. 2 (1825) 42.

Grey-tomentose herbs. Leaves alternate, decurrent along the stem. Heads small, densely clustered into globose, ellipsoid, or cylindrical glomerules, heterogamous; involucle ovoid or campanulate, phyllaries in few rows, narrow, inner gradually shorter, linear, rigidly scarious, deciduous together with flowers, outer much shorter. Marginal flowers several, female; corolla filiform, minutely 2- or 3-dentate or truncate; style-arms filiform, rather long, exserted; achene small, oblong, 4- or 5-costate, pappus setaceous, hairs white, fine, ciliate. Disc flowers few or one, bisexual, often sterile; corolla tubular, thin, 5-lobate; anthers sagittate and caudate at the base, obtuse at the apex, auricles very fine, connate; style-arms lanceolate, short; achene and pappus like those of marginal flowers; receptacle minute.

Distribution: about 30 species in N., C., and S. America, Burma, S. China Malesia, Australia, New Caledonia.

KEY TO THE SPECIES IN NEW GUINEA

- i a. Leaves obovate-oblong, minutely dentate; glomerules of heads in terminal spikes 1. *P. redolens*
 b. Leaves oblong, repand or subentire; glomerules of heads solitary, terminal, sessile or on winged peduncles. 2. *P. sphacelatum*

1. *Pterocaulon redolens* (Forst. f. ex Willd.) F.-Vill., Noviss. App. Blanco, Fl. Filip., 3rd ed., 4, 3 (1880) 116; Mattfeld, Bot. Jahrb. 62 (1929) 426; Merr. & Chun, Sunyatsenia 2 (1935) 329; Craib in Kerr, Fl. Siam. 2 (1936) 268. — *Conyzza redolens* Forst. f. ex Willd., Sp. Pl. 3 (1803) 1951. — *Monenteles spicatus* Labill., Sert. Austro-caled. 2 (1825) 43, t. 43; Benth. Fl. Austr. 3 (1866) 523. — *Pterocaulon cylindrostachyum* Clarke, Comp. Ind. (1876) 98; Hook. f., Fl. Br. Ind. 3 (1881) 275; Bailey, Weeds Pois. Pl. Qld (1906) f. 135; Gagnepain, Fl. Gén. I.-C. 3 (1924) 550, f. 57: 1—7. — *Pterocaulon spicatum* (Labill.) Domin, Bibl. Bot., Heft 89 (1929) 1218.

Erect herb, 30—100 cm tall, often much branched in the upper part, stem sparsely greyish lanate-tomentose, in the lower part glabrescent, 2—6 mm thick, wing entire, greyish lanate-tomentose, internodes 1—2 cm long. Leaves obovate-oblong, narrowed to the base, rounded or nearly so at the apex, minutely dentate, chartaceous, densely greyish lanate-tomentose below, thinly so above, 1—5.5 cm long, 0.5—2 cm broad. Glomerules of heads small, globose or ellipsoid-oblong, sessile, in terminal 2—7 cm long spikes; heads ellipsoid-oblong; involucle ovoid, 5 mm long, phyllaries 4-seriate, inner linear-lanceolate, acuminate and acute, rigid, stramineous, pale brownish, shining, glabrous, outer narrowly spatulate, obtuse or rounded, densely dingy crisp-lanate. Marginal flowers 20—25; corolla 2- or 3-dentate, 3 mm long; achene dark brown, 0.75 mm long, sparsely shortly pilose, pappus 2.5 mm long. Disc flower one; corolla 3 mm long, lobes deltoid-ovate, glandular at the upper part; achene 0.5 mm long, empty, pappus 2.5 mm long.

Distribution: Burma, Thailand, Laos, Vietnam, Malay Peninsula, Philippines, New Guinea, Australia, New Caledonia, New Hebrides.

NEW GUINEA. East. Milne Bay Dist.: Uga, 1949, Cruttwell 173 (K). — Central Dist.: Kapa to Kaili, 1889, MacGregor s.n. (MEL); Port Moresby, s.d., Goldie s.n. (MEL); E. footslopes Tovobada Hills, 12 m. N. of Port Moresby, 1965, Heyligers 1229 (L); Port Moresby Subdist., Tupuseleia, 1967, Kairo & Streimann NGF 30803 (L); Hisiu, 1935, Carr 11451 (A, BM, L, NY). — Morobe Dist.: Kajabit, 1939, Clemens 10519 (A); Markham valley, Erap near Lea, 1958, Henty NGF 9841 (BO, BRI, L, LAE), 1959, 10684 (LAE).

Collectors' annotations: aromatic, malodorous; leaves dull green above, grey green below; corolla faint pink, white, white tinged pale mauve, or red and white.

Ecological notes: roadside weed; in open grassland; in open savannah land; in strand vegetation; on bare patch of ground with plenty of humus; in woodland. Altitude: 0—300 m.

2. Pterocaulon sphacelatum (Labill.) F. v. M., Syst. Census Austr. Pl. 1 (1882) 79; Bailey, Queensl. Fl. 3 (1900) 824; Britten, Ill. Austr. Pl. Banks and Sol. 2 (1901) 49 t. 156; Domin, Bibl. Bot. Heft 89 (1929) 1218; Koster, Fedde Repert. 34 (1933) 14; in Backer & Bakh., Fl. Java 2 (1965) 392. — *Monenteles sphacelatus* Labill., Sert. Austro-caled. 2 (1825) 43, t. 44; Benth., Fl. Austr. 3 (1866) 523; Benth. & Hook. f., Gen. Pl. 2 (1873) 295.

Herbs 25—60 cm tall, upper part branched, stem 2—6 mm thick, together with entire wing densely lanate-tomentose, hairs long, crispy, hyaline, inflated at the base; internodes 1—3 cm long. Leaves oblong, rounded and apiculate at the apex, repand or subentire, chartaceous, thinly greyish more or less crispy-tomentose above, densely so below, 1—4.5 cm long, 0.5—2 cm broad, higher ones smaller. *Glomerules* of heads globose or ellipsoid, 1—1.5 cm wide, terminal, sessile or on 0.5—1.5 cm long winged peduncles; heads ellipsoid-oblong, involucre ovoid, 4 mm long, phyllaries 4-seriate, inner linear-lanceolate, acuminate and acute, rigid, whitish stramineous, shining, glabrous, outer narrowly spathulate, obtuse or rounded, densely white crispy-lanate. *Marginal flowers* 10—20; corolla finely 2- or 3-dentate, purplish, 3 mm long; achene pilose, 1 mm long, pappus 3 mm long. *Disc flower* one; corolla 3.5 mm long, lobes deltoid-ovate, glandular at the upper part; achene 0.75 mm long, empty, pappus 3 mm long.

Distribution: SE. Malesia (Kangean I., Buton I., Lesser Sunda Is, New Guinea), Australia, New Caledonia.

NEW GUINEA. East. Milne Bay Dist.: Milne Bay, 1889, MacGregor s.n. (MEL). — Central Dist.: Kairuhu Subdist., Rogers Airstrip, 8 m. W. of Kanosia Plantation, 1962, Derbyshire 647 (L); island off Red Scar Point, 1849, MacGillavry 473 (K); Fisherman I., 1880, Chalmers s.n. (MEL).

Collectors' annotations: erect herb up to 90 cm tall; corolla faintly purple.

Ecological notes: open savannah. Altitude: 9 m.

2. SPHAERANTHUS

L., Sp. Pl. (1753) 927; Lessing, Syn. Gen. Comp. (1832) 201; Benth. & Hook. f., Gen. Pl. 2 (1873) 294; Clarke, Comp. Ind. (1876) 96; Hook. f., Fl. Br. Ind. 3 (1881) 274; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 178; Robijns, Kew Bull. (1924) 177; Ross-Craig, Hook. Ic. Pl. V, 6 (1954) 1; Koster in Backer & Bakh., Fl. Java 2 (1965) 391.

Herbs. *Leaves* alternate, nearly always decurrent along the stem. *Heads* minute, densely clustered in terminal or axillary, nearly always pedunculate, globular or ovoid glomerules, heterogamous; involucre narrowly campanulate, phyllaries about equal in length. *Marginal flowers* many, female; corolla tubular, minutely 3-dentate, more or less swollen, subcartilaginous; style shortly bifid; achene oblong, pappus wanting. *Disc flowers* one or few, bisexual or male; corolla tubular-campanulate, 5-lobed, subcartilaginous; anthers

sagittate or subcaudate, with acute basal auricles, obtuse at the apex; style undivided or minutely bifid, papillose; achene oblong, pappus wanting; receptacle small, naked, variable in shape.

Distribution: 37 species in Iraq, Iran, tropical Asia, Africa, Australia.

1. Sphaeranthus africanus L., Sp. Pl. ed. 2 (1763) 1314; Hook. f., Fl. Br. Ind. 3 (1881) 275; Valetin, Bull. Dép. Agr. Ind. Néerl. 10 (1907) 69; Robijns, Kew Bull. (1924) 196; Gagnepain, Fl. Gén. I.-C. 3 (1924) 566, f. 60: 8—17; Mattfeld, Bot. Jahrb. 62 (1929) 426; Craib in Kerr, Fl. Siam. 2, 3 (1936) 267; Ross-Craig, Hook. Ic. Pl. V, 6 (1954) 18, t. 3501 A; Koster in Backer & Bakhu., Fl. Java 2 (1965) 391.

Erect herb, often much branched, 25—50 cm tall or taller, stem winged, 3—5 mm thick, sparsely pilose, wing entire or nearly so, branches often spreading. *Leaves* decurrent along the stem, oblanceolate-elliptic, oblanceolate, or oblong-lanceolate, acutely mucronate, subentire or minutely repand-denticulate, sparsely crispy pilose at both sides, 1.5—7 cm long, 0.3—1.8 cm broad. *Glomerules* pedunculate, globose or subglobose, 6—9 mm wide, with a few obovate-lanceolate, acute and acuminate, shortly pilose, glandular bracts at the base, peduncles mostly winged, 0.5—2.5 cm long; heads numerous, phyllaries about 7 or more, oblong-spathulate or obovate-oblong, apiculate, faintly undulate at the upper part, sometimes navicular, for the greater part scarious, glabrous, sometimes glandular at the upper part, 2—3 mm long. *Marginal flowers:* corolla obovoid or ovoid-cylindrical, subcartilaginous in the lower part, abruptly narrowed into the short conical-cylindrical upper part, glabrous, 1—1.5 mm long; style-arms obtuse, short; achene oblong, somewhat angular, shortly pilose and glandular, 0.75—1 mm long, on a short stipe, often stipe-like and empty. *Disc flowers:* corolla somewhat laterally compressed, glabrous, 1.5 mm long, longer lower part subcartilaginous, shorter upper part slightly narrowed, lobes deltoid, subacute; style exserted, very shortly bifid; achene 1 mm long, glandular, on a short stipe, often stipe-like and empty; receptacle shortly obconical.

Distribution: Africa, Madagascar, India, Ceylon, Burma, Thailand, Vietnam, China, Malesia, Australia.

NEW GUINEA. East. Western Dist.: Saibai I., 1885, *Stewart s.n.* (MEL). — West. Merauke, 1904, Koch *s.n.* (BO, L), 1954, McKee 1671 (L, LAE); S. and SW. New Guinea, *Zippelius s.n.* (L).

Collectors' annotation: more or less prostrate.

Ecological note: weed in rice field.

3. EPALTES

Cassini, Bull. Sc. Soc. Philom. Paris (1818) 139; Dict. Sc. Nat. 15 (1819) 6; Lessing, Linnaea 5 (1830) 147; Syn. Gen. Comp. (1832) 206; Benth., Fl. Austr. 3 (1866) 529; Benth. & Hook. f., Gen. Pl. 2 (1873) 293; Clarke, Comp. Ind. (1876) 96; Hook. f., Fl. Br. Ind. 3 (1881) 274; Hoffmann in E. & P., Nat. Pfl. Fam. 4, 5 (1894) 178; Bailey, Queensl. Fl. 3 (1900) 821; Burbidge, Dict. Austr. Pl. Gen. (1963) 113.

Herbs. *Leaves* alternate. *Heads* small, disc-shaped, heterogamous; involucle ovoid, campanulate, or basin-shaped, phyllaries imbricate. *Marginal flowers* numerous, many-seriate, female; corolla filiform-tubular, 2- or 3-dentate; style-arms thin, obtuse; achene ribbed, pappus wanting. *Disc flowers* few, bisexual, often sterile; corolla tubular, limb somewhat broadened or campanulate, 3—5-dentate; anthers sagittate and caudate at the base, with connate acuminate basal auricles and with an obtuse apical appendage; style

undivided, subulate, or with two short obtuse branches, papillose at the upper part; achene ribbed, often abortive, pappus wanting or consisting of 2 or 3 deciduous bristles; receptacle flat or concave in the centre, naked, alveolate.

Distribution: 17 species in tropical Africa, Madagascar, Asia, Australia, New Caledonia, Mexico, Cuba, Brasil.

I. Epaltes australis Less., Linnaea 5 (1830) 148; Benth., Fl. Austr. 3 (1866) 530; Bailey, Queensl. Fl. 3 (1900) 822; Banks & Solander, Ill. Bot. Cook Voy. Austr. Pl. 2 (1901) pl. 158; Bailey, Weeds. Pois. Pl. Queensl. (1906) f. 134; Merrill, Enum. Phil. Pl. 3 (1923) 607; Ridley, Fl. Mal. Pen. 2 (1923) 195; Domin, Bibl. Bot. Heft 89 (1929) 1217; Craib in Kerr, Fl. Siam. 2, 3 (1936) 267.

Prostrate or nearly so, diffuse herb, 5—24 cm tall, much branched, stem 1—3 mm thick, sparsely crispy-pilose, internodes 0.5—1.5 cm long. Leaves sessile, spatulate, attenuate to the truncate or faintly auriculate base, rounded at apex, shortly dentate except for the entire lower part, chartaceous, minutely glandular and more or less crispy sparsely pilose (hairs many-celled) on both surfaces, 1.5—5 cm long, 0.3—1.5 cm broad. Heads in or somewhat below the axils of the upper leaves, 1—3 together, sessile or shortly pedunculate, 4—6 mm wide; involucre basin-shaped, 3—4 mm long, phyllaries 3-seriate, scarious, obovate-oblong, glossy, outer rounded, inner nearly so and mucronulate at the apex. *Marginal flowers:* corolla 0.75 mm long; achene oblong, glandular, 0.75 mm long. *Disc flowers:* corolla 1 mm long, limb campanulate, 4- or 5-dentate, tube short; achene like that of marginal flowers but often abortive.

Distribution: India, Thailand, Indo-China, S. China, Japan, Malay Pen., Philippines, New Guinea, Australia, New Caledonia, Loyalty Is.

NEW GUINEA. East. Milne Bay Dist.: Sudest I., Joe Landing, 1956, Brass 27780 (A, L, LAE); Sudest I., 1965, Henty NGF 27103 (L, LAE); Misima I., Narian, 1956, Brass 27606 (A, L). — Western Dist.: Daru I., 1963, Womersley NGF 17786 (L); Arufi, Wassi Kussa R., 1968, Henty & Katik NGF 38641 (L).

Collectors' annotations: aromatic; somewhat fleshy; corolla red, reddish, or brownish; style-arms red.

Ecological notes: muddy ground on edge of mangrove swamp; low coral-limestone foreshores, foreshore among short grass; river bank and edge of dug drain in savannah. Altitude: sea level.

4. HELICHRYSUM

P. Miller, Gard. Dict. Abr. ed. 4 (1754) ('*Elichrysum*'); corr. Persoon, Syn. Pl. 2 (1807) 414, *nom. cons.*; Lessing, Syn. Gen. Comp. (1832) 274; Benth., Fl. Austr. 3 (1866) 612; Benth. & Hook. f., Gen. Pl. 2 (1876) 309; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 190; Robertson in Black, Fl. S. Austr. 4 (1957) 907; Burbidge, Dict. Austr. Pl. Gen. (1963) 146.

Shrubs, undershrubs or herbs. Leaves alternate or lower ones rarely opposite, entire. Heads solitary or corymbose, small or large, heterogamous or homogamous; involucle various in shape, phyllaries many-seriate, imbricate, outer gradually shorter, scarious, rigid, white or variously coloured, inner often so only in the longest upper part. *Marginal flowers* few or wanting, female; corolla tubular, slender, 2- or 3-dentate; style-arms truncate; achene small, cylindrical, 5-angular or slightly compressed or terete, pappus setaceous, setae hairlike, very fine or rarely wanting. *Disc flowers* few to numerous, bisexual; corolla tubular, 5- or rarely 4-lobed; anthers sagittate-caudate, auricles very fine; style-arms truncate or sometimes with conical apex; achene and pappus like those of

marginal flowers; receptacle various in shape, usually naked, rarely some scales occurring among the innermost flowers, alveolate.

Distribution: a large number of species in Europe, Africa, Asia, Australia.

I. Helichrysum bracteatum (Vent.) Andrews, Bot. Repos. 6 (1805) sub t. 428; Benth., Fl. Austr. 3 (1866) 620; Domin, Bibl. Bot. Heft 89 (1929) 1222; Robertson in Black, Fl. S. Austr. 4 (1957) 910, f. 1209. — *Xeranthemum bracteatum* Vent., Jard. Malm. (1803) t. 2; Andrews, o.c. 6 (1804) t. 375.

Erect perennial herbs, 25–80 cm tall, often much branched, stem 2–5 mm thick, thinly whitish arachnoid-lanate, glandular, internodes 1–4 cm. Leaves sessile, variable in shape, linear-lanceolate, (ob)lanceolate, or elliptic-oblong, chartaceous, truncate, somewhat rounded or slightly auriculate at the base, acute and finely acuminate or mucronate at the apex, thinly whitish arachnoid-lanate and densely covered with minute gland hairs at both sides, 3–14 cm long, 0.2–2.5 cm broad, midrib prominent below, lowest leaves in young plants crowded at the base, subrosulate. Heads terminal and in the axils of the upper leaves, large, on gradually attenuate, whitish lanate, 7–19 cm long peduncles bearing some small leaflike bracts; involucle hemispheric-campanulate, 18–25 mm long, phyllaries glossy, orange-yellow, afterwards yellow-brown, outer broadly ovate, mucronate, inner ovate-oblong, lanceolate-oblong to lanceolate, shortly acuminate, with a fairly short stramineous basal part fringed at the margin. Marginal flowers few; corolla filiform-tubular, swollen at the base, 5 mm long; style-arms somewhat flattened, canaliculate, truncate; achene cylindrical, 5-angular, glabrous, 2 mm long, pappus 8 mm long, setae cohering at the base, orange, ciliate. Disc flowers very numerous; corolla 8 mm long, tube long, limb narrowly campanulate, lobes fairly long, acute; style-arms somewhat flattened, canaliculate, with papillose conical apex; achene and pappus like those of marginal flowers; receptacle large, flat, naked.

Distribution: New Guinea, Australia, Tasmania, Cook Is.

NEW GUINEA. East. Morobe Dist.: Mumeng Subdist., Mapos, 1968, Streimann & Kairo NGF 35825 (L); Wau Subdist., between Kaisenik and Wuri-Wuri, 1968, Streimann & Kairo NGF 39130 (L); Menyamya, 1968, Streimann & Kairo NGF 35872 (L). — E. Highl. Dist.: base of Kratke Mts, 12 m. S. of Aiyura, 1963, Hartley 12159 (L); ibidem, Obura, 1959, Brass & Collins 32176 (NA); NE. slopes of Mt Michael, Lufa-Goroka Rd, 1959, Womersley NGF 11737 (BRI, LAE); Wononara Patrol Post, above Guaiga R., Kainantu Subdist., 1963, Henty & Carlquist NGF 16517 (L); Henganofi, 1967, Streimann NGF 35697 (L); Lower Benabena R., 1957, Robbins 854 (CANB, L, LAE); Goroka, Town Area, 1954, Womersley et al. NGF 6178 (A, BM, BO, CANB, L, LAE); ibidem, J. Leahy's Logging area, 1954, Womersley & Floyd NGF 6151 (A, BRI); Upper Asaro R., near Miruma, scattered, 1956, Hoogland & Pullen 5410 (BM, CANB, L); Marafunga, c. 20 m. NW. of Goroka, 1964, Hartley 13237 (L). — W. Highl. Dist.: Tomba, 1957, Saunders 660 (BM, CANB, L, LAE); N. slopes Sugarloaf complex, along Wapu R., common, 1960, Hoogland & Schodde 7075 (L); Wabag-Laiagam Rd, near Lake Iwiva, 1962, Womersley NGF 15288 (L); Ambum-Mari-muni Divide, upper Ambum valley, 1960, Robbins 3098 (CANB); 4 m. NW. of Laiagam, frequent, 1965, Flenley ANU 2522 (CANB, L); near Kepilam, Lagap valley, 1960, Hoogland & Schodde 7379 (L); Sirunki, 1962, Walker ANU 384 (L). — S. Highl. Dist.: pass between Mt Ne and Mt Kerewa, 1966, Kalkman 4839 (L). — Western Dist.: Oriomo R., Wuroi, not common, 1934, Brass 5704 (BM, BO, L, NY, these specimens have smaller heads on thin peduncles).

Collectors' annotations: spreading herb up to 2 m; leaves dull green above, (grey-) green below; corolla of marginal flowers yellow, of disc flowers (bright, deep, golden, orange, reddish) yellow, orange, or yellow and red. **Uses:** heads worn by Huli-men (S. Highlands) in their wigs.

Ecological notes: (secondary, dry, treefern-, savannah-) grasslands; on tussocks of sedges and low shrubs and ferns in swamps; native garden; on organic mud, on red

clays, on limestone; according to local natives greatly reduced in numbers since the practice of burning grasslands has been abandoned. Altitude: 1400—4000 m, also 10—30 m (Oriomo R., Wuroi).

5. PHACELLOTHRIX

F. v. M., Fragm. Phyt. Austr. 11 (89) (1878) 49; Bailey, Queensl. Fl. 3 (1900) 845; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 190; Burbidge, Dict. Austr. Pl. Gen. (1963) 227.

Herbs. Leaves alternate. Heads solitary, terminal, homogamous, many-flowered; involucre basin-shaped, phyllaries 3- or 4-seriate, scarious, with pellucid margins, outer gradually shorter. Corolla tubular, 5-lobed; anthers sagittate at the base, without basal appendages, with a lanceolate subacute apical appendage; style-arms lanceolate-subulate, papillose; achene oblong, pappus setaceous, hairs uni-seriate, 2—4 connate at the lower part, scabrid; receptacle naked.

Distribution: one species in Malesia and Australia.

I. Phacelothrix cladochaeta (F. v. M.) F. v. M., Fragm. Phyt. Austr. 11 (89) (1878) 49; Bailey, Queensl. Fl. 3 (1900) 845. — *Helichrysum cladochaetum* F. v. M., Fragm. Phyt. Austr. 5 (40) (1866) 199. — *Rutidosis brownii* Benth., Fl. Austr. 3 (1866) 594 (syn. acc. to Bailey, l.c.).

Erect delicate annual herb, simple or branched, 20—55 cm tall, stem more or less rigid, 1—1.5 mm thick, somewhat grooved, white-lanuginose, internodes 2.5—3 cm long, branches elongate. Leaves sessile, linear-lanceolate, oblanceolate, or narrowly spatulate, acutely mucronate at the apex, gradually attenuate to the base, adnate at the lower part, entire, membranaceous, thinly white-lanuginose or subglabrous above, densely white-lanuginose below, 1.5—3.5 cm long, 0.2—0.7 cm broad. Heads hemispherical, on elongate, filiform, white-lanate, 7—17 cm long peduncles, without bracts or with one minute linear bract; involucre 4—5 mm long, phyllaries lanceolate-subulate, glabrous, minutely glandular, one-nerved. Flowers bisexual; corolla 3 mm long, lobes lanceolate, acute; achene brown, glandular, glutinous, 1.5 mm long, usually fertile, pappus 2 mm long, dirty white; receptacle flat, tuberculate.

Distribution: Malesia (Aru Is and southern New Guinea) and northern Australia.

NEW GUINEA. East. Western Dist.: Fly R., Gaima, common, 1936, Brass 8269 (A, BM, BO, L, LAE); Oriomo R., Wuroi, scattered, common, 1934, Brass 5738 (BO, GH, NY). — West. Merauke Subdist.: Koerik, Noordpolder, not abundant, 1962, Hoogerwerf 240 (L); ibidem, bank of Koembe R., relatively abundant, 1954, van Royen 4853 (L).

Collectors' annotation: corolla yellow.

Ecological notes: in short to long grass of savannahs; on hard soil. Altitude: 3—10 m.

6. ANAPHALIS

DC., Prodr. 6 (1837) 271; Benth. & Hook. f., Gen. Pl. 2 (1876) 303; Clarke, Comp. Ind. (1876) 101; Hook. f., Fl. Br. Ind. 3 (1881) 279; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 186; Boerlage, Handl. Fl. Ned. Ind. 2 (1899) 192; Gagnepain, Fl. Gén. I.-C. 3 (1924) 553; Koster in Backer & Bakh., Fl. Java 2 (1965) 392.

Perennial herbs, shrubs, or small trees, whitish lanate. Leaves alternate, sessile, one-nerved, entire. Heads in terminal and axillary dense corymbs, often combined into corymbiform compound inflorescences, shortly peduncled, many-flowered, heterogamous or

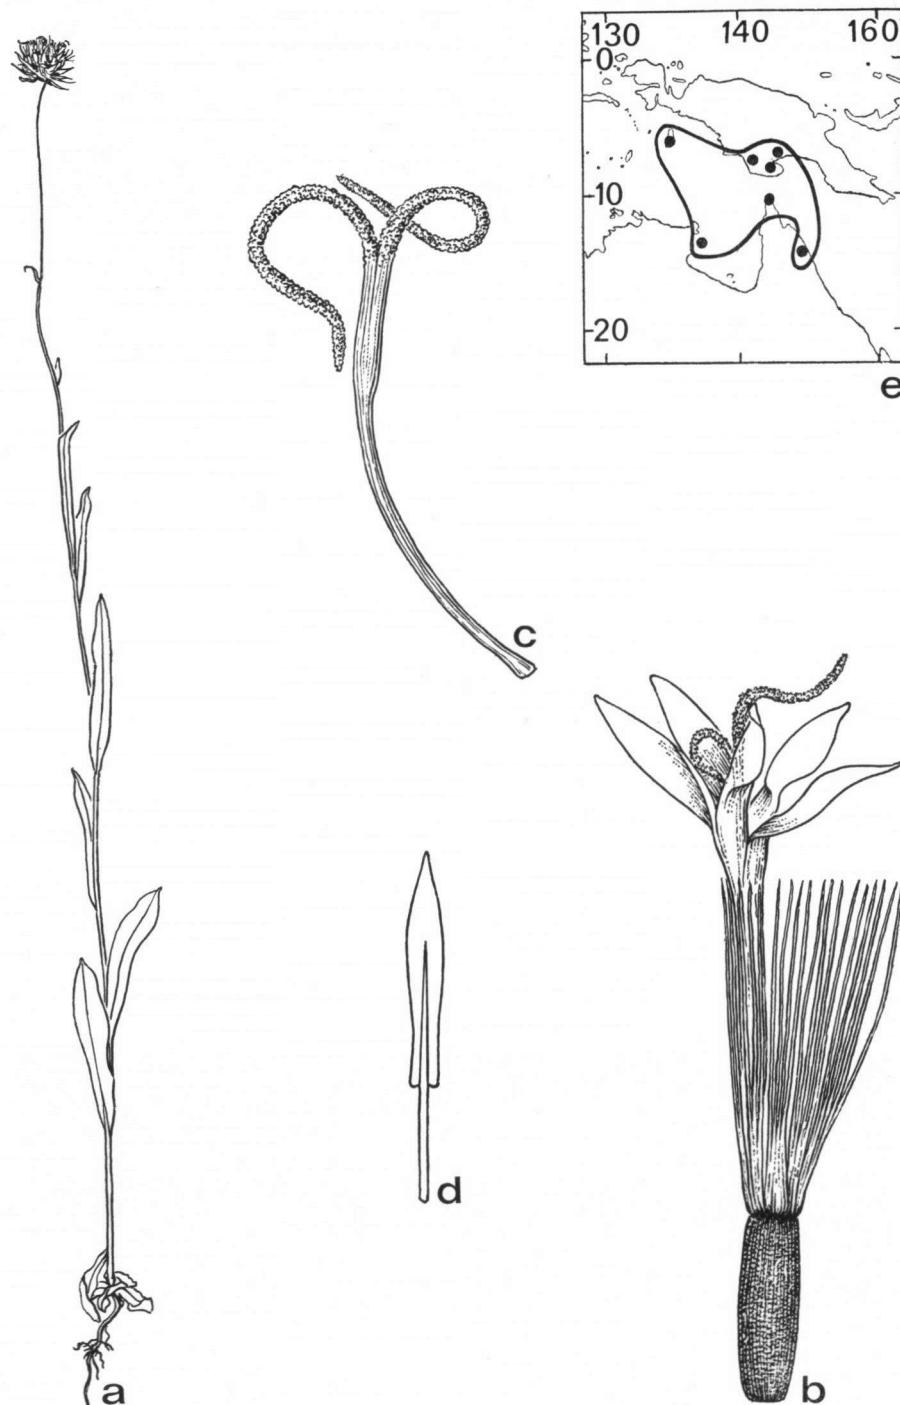

Fig. 1. *Phacelothrix cladochaeta*. — a. Habit, $\times \frac{1}{4}$; b. flower, $\times 45$; c. style, $\times 45$; d. anther, $\times 45$; e. distribution. — (a-d: Brass 8269).

homogamous; involucre campanulate, expanded at an advanced age, phyllaries imbricate, 4- or 5-seriate, rigid, membranous with a hard lower part, mostly glabrous, more or less glossy, whitish, outer gradually shorter. *Marginal flowers* many-seriate or wanting, female. *Disc flowers* 1-50, bisexual or masculine, proportion of the number of female flowers to that of bisexual or masculine ones variable in one and the same species. *Corolla* whitish or light yellow, in the marginal flowers filiform, with a 3- or 4-(sometimes 5-) dentate top, in the disc flowers tubular, with a widened 5-lobed top, minutely glandular; anthers sagittate at the base, on both sides with a filiform basal appendage; style-arms short in female and masculine flowers; achenes more or less oval, more or less 3-angular, somewhat compressed, brown, minutely glandular, in masculine flowers empty; pappus hairs one-seriate, dentate, dingy-white, in disc flowers more or less distinctly clavate; receptacle conical or flat, naked, alveolate.

Distribution: about 100 species, most in Asia, several in N. and S. America; temperate and montane plants.

KEY TO THE SPECIES IN NEW GUINEA

- 1 a. Leaves very small, 0.4-1.0 cm long, 0.2-0.25 cm broad; heads solitary, terminal; phyllaries very acute. 1. *A. papuana*
- b. Leaves 0.5-8 cm long, 0.2-1.3 cm broad; heads (sometimes few) in terminal corymbs; phyllaries acute, subacute or obtuse 2
- 2 a. Leaves very dense in the lower part of the stem, small, 0.5-2.7 cm long, 0.2-0.4 cm broad; heads 3-21 together, in thin corymbs; involucre 7-10 mm long 2. *A. mariae*
- b. Leaves 2-8 cm long, 0.2-1.3 cm broad; heads numerous, in dense corymbs; involucre 5-6 mm long 3
- 3 a. Leaves lanceolate, densely lanate above; phyllaries ovate to oblong, obtuse or subacute, stramineous 3. *A. lorentzii*
- b. Leaves linear-lanceolate, glabrous or nearly so above; phyllaries oblong-lanceolate, acuminate, acute, membranous 4. *A. arfakensis*

I. *Anaphalis papuana* (Lauterbach) Koster nov. comb. et stat. — *Anaphalis* ? *nubigena* DC. var. *papuana* Lauterbach, Nova Guinea 8 (1914) 864. — *Anaphalis monocephala* S. Moore, Trans. Linn. Soc., Bot. 9 (1916) 85, nom. illeg., non DC., Prodr. 6 (1837) 18; Mattfeld, Nova Guinea 14 Bot. (1928) 525; Bot. Jahrb. 62 (1929) 427; van Steenis, Bull. Jard. Bot. Btzg III, 13 (1934) 185.

Small shrubs, 20-35 cm tall, often much branched, stems terete, slender, 1-2 mm thick, white lanate, partly procumbent; internodes 2-5 mm long. Leaves very dense in the lower part of the stems, less dense in the upper part, oblong- or obovate-lanceolate, with revolute margins, densely white lanate on both sides except for the glabrous acute top, basal part appressed to the stem, herbaceous, 0.4-1 cm long, 0.2-0.25 cm broad. Heads terminal, solitary; involucre 10-14 mm long, phyllaries 5-seriate, numerous, stramineous, shining, dingy-white, lanceolate, rarely bidentate at the top, very acute, glabrous except whitish lanate outer ones. *Marginal flowers* numerous, 4 mm long; corolla 3 mm long, 5-dentate at the apex; style-arms fairly broad, papillose at the top; achene 1 mm long, oblong, pappus hairs dingy-white, 4 mm long, very acute. *Disc flowers* 4 mm long; corolla campanulate-infundibuliform, 3 mm long; style-arms somewhat broadened, rounded and papillose at the top; anthers caudate at the base; achene and pappus as in marginal flowers; receptacle flat.

Distribution: New Guinea.

NEW GUINEA. West. Mt Wilhelmina, Wilhelmina-top, 1909, Lorentz 1345 (BO, L, type); eod., N. slopes, plentiful, 1938, Brass & Meyer-Drees 10048 (L); eod., 7 km NE. of Wilhelmina-top, 1938, Brass &

Meyer-Drees 10017 (A, L); eod., 2 km E. of Wilhelmina-top, near waterfall, 1938, *Brass & Meyer-Drees 10348* (A, L); eod., Quarles valley, *Versteeg 2509* (BO, L), 2512 (L). Mt Carstensz, Dajakweide and surroundings, *Wissel 75* (BO); Mt Carstensz, 1913, *Kloss 14* (K).

Collectors' annotations: corolla of marginal flowers white, of disc flowers yellow.

Ecological notes: in alpine grassland; on wet limestone, among rocks and loose earth of screes, in dry places under rocks. Altitude: 3560—4500 m.

Remark: This species differs from the resembling *A. nubigena* DC. by the dense lower leaves and the stramineous phyllaries. In *A. nubigena* the leaves are distant, larger and broader; the phyllaries are white.

2. *Anaphalis mariae* F. v. M., Trans. R. Soc. Vict. 1, 2 (1889) 8; Boerlage, Handl. Fl. Ned. Ind. 2 (1891) 240; S. Moore, Trans. Linn. Soc., Bot. 9 (1916) 85; Mattfeld, Bot. Jahrb. 62 (1929) 428; van Steenis, Bull. Jard. Bot. Btzg III, 13 (1934) 185. — *Anaphalis nouhuysii* Lauterbach, Nova Guinea 8 (1912) 865; Mattfeld, l.c.; van Steenis, l.c. — *Anaphalis ?mariae* F. v. M. var. *lanuginosa* Lauterbach, l.c.

Small shrubs, simple or (often much) branched, 12—75 cm tall, stems partly procumbent, ascending, partly erect, white lanate, glabrescent, slender, terete, 1—3 mm thick, internodes 1—10 mm long. Leaves very dense in the lower part of the stems, often less dense in the upper part, afterwards recurved, linear-elliptic or linear-ob lanceolate, mucronate and acute at the top, with involute margins, chartaceous, more or less white lanate or glabrous above, densely white lanate below, 0.5—2.7 cm long, 0.2—0.4 cm broad, lower ones smaller. Heads 3—21 together (only 1 or 2, as mentioned by F. v. M. in his diagnosis, was not found, neither in the type and the isotypes, nor in other specimens), in thin terminal corymbs, peduncles 0.5—2.5 cm long; involucre 7—10 mm long, phyllaries 4- or 5-seriate, chartaceous, shining, white or dingy-white except for the brownish basal part, lanceolate, obtuse or acute, often with some short teeth at the top, glabrous. Marginal flowers many; corolla 2.5 mm long, papillose at the top; style-arms truncate, finely papillose; achene turbinate-oblong, hirsute, 0.5 mm long, pappus 3 mm long. Disc flowers many; corolla 3 mm long; style-arms truncate and papillose at the top; anthers caudate at the base, obtuse at the top; achene oblong, sparsely hirsute, 0.5 mm long, pappus 3 mm long; receptacle conical, afterwards flat.

Distribution: New Guinea.

Collectors' annotations: lax, bushy, straggling, sprawling, (semi-) woody, shrubby herb, up to 1.2 m; solitary or forming large loose clumps or small colonies, gregarious; leaves shining (dark) green above; corolla of marginal flowers white or cream, of disc flowers pale green to yellow, light brown, ochre.

Ecological notes: montane to alpine grasslands, forest borders, (mossy) forests, rocky slopes; on fine loam, limestone, basalt, granite. Altitude: 2550—4400 m.

a. *forma mariae* — *Anaphalis nouhuysii* Laut.

Upper side of leaves glabrous or rarely with white lanate midrib.

Mt Wilhelmina, summit, 1909, *van Nouhuys* 27 (U, type of *Anaphalis ?mariae* F. v. M. var. *lanuginosa* Laut.).

3. *Anaphalis lorentzii* Lauterbach, Nova Guinea 8 (1914) 865; Mattfeld, Bot. Jahrb. 62 (1929) 429; van Steenis, Bull. Jard. Bot. Btzg III, 13 (1934) 185. — ?*Anaphalis hellwigii* Warb., Bot. Jahrb. 16 (1893) 28; Mattfeld, l.c. (no specimens of this species were seen by the author; Mattfeld presumes that it is not different from *A. lorentzii*; probably the type specimen was destroyed).

Erect herbs, 15—175 cm tall; one or few 4—8 mm thick stems together, (often much) branched or not branched, with creeping stems, densely whitish lanate, with scattered fairly short glandular hairs among the woolly hairs and covered by them; lower part of plant leafless (leaves dropped); internodes 3—10 mm long. Leaves dense, lanceolate, truncate at the base, acute at the top; at both sides with a dense white, dingy-white, or pale brownish, woolly indumentum thinly interspersed with crispy articulate glandular hairs; chartaceous; 2—7 cm long, 0.2—1.3 cm broad. Heads numerous in terminal, composed, dense, 1.5—13 cm broad corymbs; heads on 1—5 mm long densely white-lanate peduncles, campanulate; involucre 6- or 7-seriate, 5—6 mm long, phyllaries obtuse or subacute, often with some teeth in the upper part, one-nerved, stramineous, shining, dingy-white or pale brownish, with a hard basal central part, outer ovate or ovate-oblong,

inner oblong. *Marginal flowers* numerous; corolla 3 mm long; achene oblong, hirsute on the ribs, 0.75 mm long, pappus hairs few, 3.5 mm long. *Disc flowers* fairly many; corolla 3.5 mm long; style-arms truncate, papillose at the top; anthers caudate at the base, subobtuse at the top; achene oblong, thinly pilose, nearly 0.5 mm long, pappus hairs few, 3.5 mm long; receptacle flat.

Distribution: New Guinea.

Collectors' annotations: (semi-) erect, growing in small clumps; phyllaries pale yellowish white, creamy; corolla of marginal flowers white, of disc flowers yellow.

Ecological notes: montane to subalpine (often wet or peaty) grasslands, sedge bogs, landslides, shrubberies, forest edges, young secondary forests, rainforests, roadsides, disturbed soil; on granite. Altitude: 1800—3750 m.

Remarks: *Anaphalis lorentzii* resembles *A. maxima* (OK.) Steen. However, *A. maxima* has oblong or oblong-lanceolate leaves, broadly truncate, nearly auriculate at the base, long-attenuate at the top, subtomentose at the upper side with fairly long crispy articulate glandular hairs and rare woolly hairs.

a. forma *lorentzii*

Leaves 2—7 cm long, 0.3—1.3 cm broad; corymbs 2—13 cm wide.

b. forma *angustifolia* Koster, *nova forma*

Folia angustiora, 3—7 cm longa, 0.2—0.3 cm lata; corymbus angustus, 1.5—5 cm latus.
Type: Brass 11522 (L).

NEW GUINEA. W e s t. Balem Valley, near Wellesley, 1966, Kostermans & Soegeng 6544 (L); Bele R., 18 km NE. of Lake Habbema, 1938, Brass 11522 (L, type; A); Lake Habbema, few, 1938, Brass 9121 (A); Mt Wilhelmina, N. slopes, Warmena R., sporadic, 1938, Brass & Meyer-Drees 10234 (A, L).

4. *Anaphalis arfakensis* Mattfeld, Bot. Jahrb. 62 (1929) 429; van Steenis, Bull. Jard. Bot. Btzg III, 13 (1934) 184; Kitamura, Bot. Mag. Tokyo 55 (1941) 346.

Herb, sometimes branched, slender, 50—70 cm tall, stems terete, 1.5—4 mm thick, densely whitish lanate, internodes 0.5—1.5 cm long. Leaves linear-lanceolate, revolute, acute at the top, herbaceous, glabrous or nearly so above, dingy-whitish lanate below, 3—8 cm long, 0.2—0.4 cm broad. Heads numerous, in dense terminal corymbs, peduncles 3—8 mm long; involucre 5 mm long, phyllaries 4-seriate, oblong-lanceolate, acuminate, acute, uni-nerved, membranous, inner ones glabrous, lower part brownish, somewhat glandular, upper part dingy-whitish, outer phyllaries filiform, acute, brownish, densely whitish lanate. Marginal flowers numerous; corolla 2.5 mm long; achene short, oblong, hirsute, 0.75 mm long, pappus 3 mm long. Disc flowers many; corolla 3 mm long; style-arms truncate, papillose; anthers obtuse at the top; achene and pappus as in marginal flowers; receptacle flat.

Distribution: New Guinea.

New Guinea. West. Arfak Mts, near Hatam, 1875, Beccari s.n. (FI, type); eod., Anggi Lakes, Lake Giji, Iray, 1940, Kanehira & Hatusima 13842 (BO).

Collectors' annotation: corolla white.

Ecological notes: secondary forest. Altitude: 1900 m.

Remark: This species resembles *A. longifolia* (Bl.) DC. and *A. contorta* Hook. f. It differs from both species by its oblong-lanceolate, acute phyllaries. In *A. longifolia* these are ovate, obtuse or subobtuse, in *A. contorta* they are oblong and obtuse.

7. GNAPHALIUM

L., Sp. Pl. (1753) 850; Lessing, Syn. Gen. Comp. (1832) 328; DC., Prodr. 6 (1837) 221; Benth., Fl. Austr. 3 (1866) 652; Benth. & Hook. f., Gen. Pl. 2 (1873) 305; Hook. f., Fl. Br. Ind. 3 (1881) 288; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 187; Koster in Backer & Bakhu., Fl. Java 2 (1965) 393; Drury, N. Zeal. J. Bot. 8 (1970) 222; 9 (1971) 157.

Whitish-lanate annual or perennial herbs. Leaves sessile, alternate, entire. Heads small, clustered, sessile or subsessile, many-flowered, heterogamous; involucre oblong or campanulate, phyllaries imbricate, 3- or 4-seriate, rigid, membranous, mostly white, yellow or brown, glossy, outer ones gradually shorter. Marginal flowers numerous, female; corolla filiform-tubular, 3- or 4-dentate; style-arms filiform; achene more or less 3- or 4-angular, pappus hairs one-seriate, finely dentate, white, often caducous. Disc flowers bisexual; corolla tubular, 5-fid; anthers sagittate at the base, with filiform basal appendages; style-arms short, truncate, achene and pappus as in marginal flowers; receptacle flat or basin-shaped, naked, alveolate.

Distribution: about 200 species, almost cosmopolitan.

KEY TO THE SPECIES IN NEW GUINEA

- | | |
|--|---------------------------|
| 1 a. Erect herbs, 5—80 cm tall; heads in clusters | 2 |
| b. Prostrate short herbs, forming mats, 1—8.5 cm tall; heads single | 4 |
| 2 a. Margins of leaves not revolute; clusters of heads without leaves at the base, heads subsessile or shortly pedunculate | 1. <i>G. luteo-album</i> |
| b. Margins of leaves revolute; clusters of heads with 2—8 leaves at the base, heads sessile | 3 |
| 3 a. Herbs with basal rosulate shoots and often with stolons; basal part of leaves remaining after leaves have decayed; disc flowers 3—6 | 2. <i>G. japonicum</i> |
| b. Herbs without basal rosulate shoots and without stolons; basal parts of leaves not remaining after leaves have decayed; disc flowers 1 or 2 | 3. <i>G. involucratum</i> |

- 4 a. Leaves linear, with revolute margins, subobtuse or subacute at the top; disc flowers 6 or 7, receptacle minute, 1 mm in diam. 4. *G. breviscapum*
 b. Leaves narrowly spatulate, slightly or not revolute at the margins, very shortly acuminate and acute at the top; disc flowers 9—15, receptacle 2—3 mm in diam. 5. *G. brassii*

1. ***Gnaphalium luteo-album* L.**, Sp. Pl. (1753) 851; Benth., Fl. Austr. 3 (1866) 653; Clarke, Comp. Ind. (1876) 114; F. v. M., Descri. Notes Papuan Pl. 6 (1885) 11; Hillebrand, Fl. Hawaiian Is (1888) 201; Moore, Trans. Linn. Soc. Bot. 9 (1916) 85; Merrill, Enum. Phil. 3 (1923) 608; Gagnepain, Fl. Gén. I.-C. 3 (1924) 556; Kearney, Peebles et al., Arizona Fl. (1951) 888; Allen, Fl. N. Zeal. 1 (1961) 699; Koster in Backer & Bakhu., Fl. Java 2 (1965) 394; Wilson in Eichler, Suppl. Black, Fl. S. Austr. ed. 2 (1965) 315.

Distribution: Europe, Madeira, Canary Is, Africa, Asia Minor, India, Thailand, Indo-China, China, Japan, Formosa, Malesia, Australia, New Caledonia, New Zealand, Hawaiian Is.; in warm and temperate regions of the Old World, adventive in N. America (acc. to Kearney, Peebles et al., l.c.).

var. *luteo-album*

Herbs, erect, 5—80 cm tall, somewhat branched in the upper part, stem terete, 1.5—2 mm thick, appressed whitish felty-lanate (hairs long). Leaves lanceolate (upper ones) or lanceolate-spatulate or spatulate (lower ones), somewhat broadened and truncate at the base, acute or obtuse at the top, uni-nerved, thinly appressed whitish felty-lanate above, densely so below, chartaceous, 1—5.5 cm long, 0.1—0.5 cm broad. Heads in terminal and often in a few lower clusters, without leaves at the base, subsessile or shortly pedunculate, oblong-campanulate; involucre 3—4 mm long, phyllaries pale brown, rounded, obtuse, or acute, often fringed at the top, outer ones ovate, inner ones oblong. Marginal flowers: corolla 2—2.5 mm long; achene oblong, brown, glabrous, 0.5 mm long, pappus 2 mm long. Disc flowers 4—7, rarely 10; corolla 2—2.5 mm long; achene and pappus as in marginal flowers; receptacle minute, somewhat basin-shaped.

NEW GUINEA. East. Central Dist.: near Port Moresby, Lawes (fide F. v. M., l.c.). — West. Utakwa R. to Mt Carstensz, 1913, Kloss s.n. (BM, K).

2. ***Gnaphalium japonicum* Thunb.**, Fl. Jap. (1784) 311; Mattfeld, Bot. Jahrb. 62 (1929) 403, 498, p.p.; Kitamura, Mem. Coll. Sc. Kyoto Imp. Univ. B, 13 (1937) 219; Allen, Fl. N. Zeal. 1 (1961) 700; Koster in Backer & Bakhu., Fl. Java 2 (1965) 394; Ohwi, Fl. Jap. (1965) 858; Wilson in Eichler, Suppl. Black, Fl. S. Austr. ed 2 (1965) 313.

Herbs, erect, more or less caespitose, 13—45 cm tall, with basal rosulate shoots and often with short or long stolons; stem unbranched or with few branches in the upper part, terete, whitish arachnoid-lanate, 1—2 mm thick. Leaves linear-lanceolate (upper ones) or linear-ob lanceolate (lower ones), broadened and truncate at the base, obtuse or minutely acuminate and acute at the top, chartaceous, uni-nerved, thinly whitish arachnoid-lanate (afterwards glabrous) above, densely so below, with revolute margins, 1—11 cm long, 0.2—0.6 cm broad, basal part remaining after leaf decayed. Heads sessile, 3—5 mm thick, many in a single dense terminal cluster 12—20 mm thick, rarely with few (about 4) smaller clusters in the axils of the upper leaves, clusters with 2—5 leaves at the base; involucre whitish arachnoid-lanate at the base, 6 mm long, phyllaries partly purplish, partly greenish brown, oblong, truncate-obtuse or obtuse, often fringed at the margin, rigid in the upper part, glabrous. Marginal flowers: corolla 3.5 mm long; achene ellipsoid-oblong, sparsely papillose, nearly 1 mm long, pappus hairs 4 mm long. Disc flowers 3—6 (mostly 4); corolla 3.5 mm long; achene (often empty) and pappus as in marginal flowers; receptacle flat.

Distribution: China, Korea, Japan, Ruykyus, Formosa, New Guinea, Australia, New Caledonia, New Zealand.

NEW GUINEA. East. Milne Bay Dist.: Mt Maneo, 1956, Cruttwell 736 (K, LAE); Mt Dayman, occasional, 1953, Brass 22547 (A, L, LAB). — Central Dist.: Mt Albert Edward, SW. slopes, rare, 1933, Brass 4361 (BRI, NY, SH). — E. Highl. Dist.: Mt Wilhelm, 1959—1965, van Balgooy 213 (L), Borgmann 20 (L), Brass 30071 (L); Mt Otto, sporadic, 1959, Brass & Collins 31002 (L); Mt Michael, common, 1959, Brass & Collins 31249 (L, NY). — W. Highl. Dist.: Mt Sugarloaf, N. slope, 1960, Hoogland & Schodde 7159 (L). — S. Highl. Dist.: Mt Giluwe, W. summit, 1961, Schodde 1964 (L); Mt Ambua, scattered, 1966, Vink 17409 (L). — West. Lake Habbema, 1938, Brass 9120 (A, L); Mt Carstensz, Carstenszweide, 1936, Wissel 163 (BO).

Collectors' annotation: florets brown.

Ecological notes: montane to alpine, wet or dry grasslands; along tracks; old native camps. Altitude: 2240—3680 m.

3. Gnaphalium involucratum Forst. f., Fl. Ins. Austr. Prodr. (1786) 55, n. 291; Mattfeld, Bot. Jahrb. 62 (1929) 430, 498, p.p.; Allen, Fl. N. Zeal. I (1961) 700; Curtis, Stud. Fl. Tasm. 2 (1963) 318; Koster in Backer & Bakh., Fl. Java 2 (1965) 394; Wilson ni Eichler, Suppl. Black, Fl. S. Austr. ed. 2 (1965) 313; Burbidge & Gray, Fl. Austr., Cap. Terr. (1970) 388.

Herb, erect, simple or bushy, 10—80 cm tall, stems rigid, 1—8, simple or much branched in the upper part or sparsely or much branched (up to 10 branches) in the basal part, 0.5—5 mm thick, appressed white felty-lanate (hairs long), internodes 1—3 cm long. Leaves often crowded, lanceolate, broadened and truncate at the base, at first rounded, finally shortly acuminate and acute at the top, upper ones linear or linear-lanceolate, acute, all chartaceous, uni-nerved, thinly appressed white felty-lanate above, densely so below, margins revolute, 1—7.5 cm long, 0.1—0.8 cm broad. Clusters of heads single to numerous, terminal or axillary, often on short or long (1—10 cm) branches, in the higher part of the stem, 8—18 mm thick, with 3—8 leaves at the base; heads sessile, 1—1.5 mm thick, involucre 5 mm long, phyllaries oblong, pale brown, often partly purplish, inner ones rounded or obtuse or with two obtuse or rounded teeth, somewhat fringed at the margin, outer ones obtuse or subacute. Marginal flowers: corolla 2.5 mm long; achene oblong, brown, sparsely papillose, nearly 1 mm long, pappus 2.5—3 mm long. Disc flowers mostly 1, sometimes 2; corolla 2.5 mm long; achene and pappus as in marginal flowers; receptacle minute, somewhat basin-shaped.

Distribution: Japan, Malesia, Australia, Tasmania, New Zealand, Hawaiian Is.

NEW GUINEA. East. Northern Dist.: Mt Aniata, 1959, Cruttwell 1058 (K). — Central Dist.: Wharton Ra., W. slope, Avios, track Samarai—Murray Pass, 1965, van Royen NGF 30127 (L); Mt Tafa, a few plants, 1933, Brass 4925 (NY). — Morobe Dist.: Edie Creek Rd, above Wau, 1963, van Royen NGF 16309 (L); Lae Subdist., Gevak-Misok village, 1960, Gillison 13 (BRI); Sattelberg, Sambanga, 1937, Clemens 6925a (A); Ogeramnang, 1936, Clemens 4478 (A); below Tobou, 1936, Clemens 4439 (A); Cromwell Mts, Mannasat, 1964, Hoogland 9427 (L); Wantroat, 1940, Clemens 10960 (A). — E. Highl. Dist.: Aiyura, slope behind Agr. Stat., 1954, van Royen 4458 (L); Lower Bena Benza R., 1957, Robbins 861 (A, BM, CANB, L, LAE); near Kerigomna camp, fairly common, 1956, Hoogland & Pullen 5511 (A, BM, BRI, CANB, L, LAE); Chimbu valley, Pombomere, 1960, Borgmann 373 (L); Mt Wilhelm, 1957—1966, van Balgooy 509 (L), Brass 30289 (L, NY), 30640 (L), McVean & Wade ANU 7135 (L), Pullen 355 (BM, CANB, L, LAE). — W. Highl. Dist.: Waghi-Jimmy Divide, Warapiri R., N. of Nondugl, scattered, 1963, van Royen NGF 18294 (BRI, L); Wabag Subdist. near Yagos, lower Tale R., 1960, Hoogland & Schodde 6707 (CANB); Lai valley, 8 m. W. of Wabag, 1960, Robbins 3047 (CANB); Sirunki, NE. slopes of Putidi Hill, 1962, Walker ANU 465 (L); Lake Iiviva, 1962, Womersley NGF 15293 (L), 1965, Flenley ANU 2505 (L); Yobobos grassland area, source of Lagaip R., 1960, Hoogland & Schodde 7456 (L); top of Lagap-Kandep Divide, 1965, Eichler 18271

(L). — S. Highl. Dist.: Tari Subdist., Ibiwara, very local, *Kalkman* 4658 (L). — West. Baliem R., 1938, *Brass* 1127 (A, L); *eod.*, Maki, 1958, *van Leeuwen MAKI* 18 (L); Swart valley, Kadubaka, 1958, *Bergman* 450 (S); Wissel Lakes, Enarotali, foot of Boebeiro, 1939, *Eyma* 4378 (A, BO, BRI, L).

Collectors' annotations: annual, up to 1.20 m tall; leaves dark green above; flowers (yellowish) brown, brownish, yellow.

Ecological notes: montane to subalpine dry or peaty grasslands; wet mixed vegetation including *Phragmites*; (*Pandanus*-)marsh; old gardens; on bare ground of landslides and along gullies; roadsides; on loam. Altitude: 1175—3575 m.

4. *Gnaphalium breviscapum* Mattfeld, Bot. Jahrb. 68 (1937) 264. — *G. clemensiae* Mattfeld, Bot. Jahrb. 70 (1940) 475.

Short herb 1—8.5 cm tall, forming mats, with stolons, stems 0.5—1 mm thick. *Leaves* rosulate at the base or on top of prostrate, filiform, angular, glabrous stolons bearing basal parts of decayed leaves. Leaves appressed, linear, canaliculate, uni-nerved, with revolute margins, somewhat broadened at the base, subobtuse or subacute at the top, chartaceous, thinly whitish felty-lanate (afterwards glabrous) above, densely so below, 0.5—2 cm long, 0.05—0.1 cm broad. *Heads* solitary at the top of leafy, whitish felty-lanate, erect, terete, 0.5—8 cm long stems; involucre oblong-campanulate, 6—8 mm long (Mattfeld mentions 8—10 mm for *G. clemensiae*), phyllaries oblong, acute, light brown, outer whitish arachnoid, inner ones glabrous. *Marginal flowers*: corolla 4 mm long; achene oblong-ellipsoid, shortly pilose, light brown, nearly 1 mm long, pappus 4.5—5 mm long. *Disc flowers* 6 or 7; corolla 4 mm long; achene cylindrical, thinly minutely pilose, often empty, pappus like that of marginal flowers; receptacle minute, somewhat basin-shaped, 1 mm in diam.

Distribution: New Guinea.

NEW GUINEA. East. Central Dist.: Mt Albert Edward, common, 1933, *Brass* 4345 (BRI, GH, type). — Morobe Dist.: Salawaket Ra., 1937, *Clemens* 5909 (A, type of *G. clemensiae* Mattf.); Mt Bangeta, summit, 1963, *van Royen* NGF 2027 (L); Matap, 1940, *Clemens* 41153 (A). — E. Highl. Dist.: Mt Michael, common, 1939, *Brass* & *Collins* 31206 (L); Mt Wilhelm, 1957—1966, *van Balgooy* 78, 116, 237, 353, 354, 570, 805 (L), *Borgmann* 81 (L), *Brass* 30160 (L, NY), *McVear & Wade ANU* 7206 (L), *Robbins* 1280 (CANB), *van Royen* NGF 16004 (L). — W. Highl. Dist.: Kubor Ra., Mt Kinkain, rather common, 1963, *Vink* 16208 (L). — S. Highl. Dist.: Mt Giluwe, W. summit, 1961, *Schodde* 1947 (L); *eod.*, E. slopes, 1969, *Coode et al.* NGF 40223, 40275 (L). — West. Mt Wilhelmina, 2 km E. of summit, common, 1938, *Brass* & *Meyer-Drees* 10216 (A, L); Lake Habbema, 1938, *Brass* 9025, 9587 (A, L).

Collectors' annotations: solitary or growing in large patches, rosettes forming mats; leaves dull green above; flowering stems at first erect, becoming curved-over in fruit; flowers yellowish, light yellow, white.

Ecological notes: wet to dry, often stony, subalpine to alpine grasslands; bare (rocky) soil; open bogs; survives regular trampling; on peat, on slate. Altitude: 3225—4350 m.

5. *Gnaphalium brassii* Mattfeld, Bot. Jahrb. 68 (1937) 265.

Short herbs 1—5 cm tall, forming mats. Leaves rosulate at the base or on top of prostrate, filiform, angular, glabrous, 0.5—1 mm thick stolons bearing basal parts of decayed leaves. *Leaves* appressed, narrowly spatulate, somewhat canaliculate, uni-nerved, slightly or not revolute at the margins, somewhat broadened at the base, very shortly acuminate at the top, chartaceous, densely whitish felty-lanate at both sides, afterwards glabrous above, 0.5—2.5 cm long, 0.3—0.5 cm broad. *Heads* solitary, terminal, at the

Fig. 2. a. *Gnaphalium breviscapum*, habit, $\times 2$ (Brass 4345). — b. *Gnaphalium brassii*, habit, $\times 2$ (Brass 4401).

top of leafy 1—4 cm long stems, or subsessile; involucre campanulate, 9—10 mm long, phyllaries oblong, acute, light brown, outer ones whitish arachnoid, inner ones glabrous. *Marginal flowers*: corolla 5 mm long; achene oblong-ellipsoid, glabrous, nearly 1 mm long, light brown, thinly minutely pilose, pappus 6 mm long. *Disc flowers* 9—15; corolla 4—5 mm long; achene like that of marginal flowers, often empty, pappus 6 mm long; receptacle more or less flat, 2—3 mm in diam.

Distribution: New Guinea.

NEW GUINEA. East: Milne Bay Dist.: Mt Gainaia, 1962, Cruttwell 1286 (L); Mt Maneo, summit, E. side, 1956, Cruttwell 778 (K). — Northern Dist.: Mt Aniata, 1959, Cruttwell 1042 (K). — Central Dist.: Wharton Ra., W. slope, track Avios—Murray Pass, 1965, van Royen NGF 20469 (L); Murray Pass, 1933, Brass 4673 (BRI, GH, NY); eod., Tsjidibombo, 1965, van Royen NGF 30121 (L); Mt Albert Edward, 1933, Brass 4401 (BRI, type; GH).

Collectors' annotation: prostrate in dense grey masses, in large patches, forming extensive mats; phyllaries pale green; corolla of marginal flowers straw-coloured, florets pale yellow, yellowish, white, pink.

Ecological notes: (open) grasslands, bare ground of wet grassland; rocky slope; dry roadsides. Altitude: 2790—3680 m.

Remark: Mattfeld, Bot. Jahrb. 70 (1940) 473, described a species of *Raoulia* Hook. for New Guinea: *R. chiliastra*, from Mt Saruwaged, 3750—4000 m alt., 1937, Clemens 5898, 5910. Both specimens have been destroyed in Berlin. No specimens of this species have been seen by the present author. Mattfeld indicated that no clear differences can be found between the genera *Gnaphalium* and *Raoulia*. For this reason, as he remarked, he could have named this species as *Gnaphalium chiliastrum* as well. Most species of *Raoulia* occur in New Zealand, very few in Tasmania. According to Allan, Fl. N. Zeal. 1 (1961) 701, a few species of *Raoulia* have been described from New Guinea. In the Kew Index, however, only *R. chiliastra* is enumerated from New Guinea.

8. PLUCHEA

Cass., Bull. Sc. Soc. Philom. Paris (1817) 31; Dict. Sc. Nat. 42 (1826) 1; Lessing, Syn. Gen. Comp. (1832) 207; Benth. & Hook. f., Gen. Pl. 2 (1873) 290; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 176; Koster in Backer & Bakh., Fl. Java 2 (1965) 390.

Shrubs, subshrubs, or rarely perennial herbs. *Leaves* alternate. *Heads* corymbose or rarely solitary and terminal, usually small, heterogamous; involucre ovoid, campanulate, or hemispherical, phyllaries imbricate, few- or many-seriate, outer gradually shorter, ovate or lanceolate, herbaceous or membranous. *Marginal flowers* numerous, many-seriate, female; corolla tubular-filiform, shortly 3- or 4-dentate; style-arms exserted, thin; achenes small, angular, pappus setaceous, hairs uni-seriate, thin, scabrid. *Disc flowers* few, masculine; corolla infundibuliform, with a 5-lobed limb; anthers sagitate, caudate, with acute appendages on either side at the base, obtuse at the apex; style undivided or shortly bifid; achenes often rudimentary, pappus setaceous; receptacle flat, naked.

Distribution: about 70 species, mainly in S. and C. America, further in N. America, tropical Africa, Canary Is, S. Asia, Australia.

I. Pluchea indica (L.) Less., Linnaea 6 (1831) 150; DC., Prodr. 5 (1836) 451; Benth., Fl. Austr. 3 (1866) 527; Clarke, Comp. Ind. (1876) 93; Hook. f., Fl. Br. Ind. 3 (1881) 272; Boerl., Handl. 2 (1891) 239; Valeton, Bull. Dép. Agr. Ind. Néerl. 10 (1907) 69; White, Proc. R. Soc. Queensl. 34 (1922) 60; Merrill, En. Phil. 3 (1923) 606; Ridley, Fl. Mal. Pen. 2 (1923) 194; Gagnepain, Fl. Gén. I.-C. 3 (1924) 522; Mattfeld, Bot. Jahrb. 62 (1929) 425; Degener, Fl. Hawaii. 3 (1934) fam. 344, ill.; Craib in Kerr, Fl. Siam. 2, 3 (1936) 266; Koster in Backer & Bakh., Fl. Java 2 (1965) 391. — *Baccharis indica* L., Sp. Pl. ed. 2 (1763) 1205.

Shrub, stem and branches ribbed, finely shortly crispy-hairy, stem 7—10 mm thick. *Leaves* very shortly petiolate or sessile, obovate, attenuate to the base, acute or mucronate at the apex, acutely serrate-dentate except for the entire basal part, subglabrous, obscurely glandular at both surfaces, 2.5—9 cm long, 1—5.5 cm broad. Corymbs terminal or axillary, more or less dense, 2.5—12.5 cm wide, branches obliquely patent; heads pedunculate or subsessile, narrowly cylindric; involucle c. 4 mm long, phyllaries 6- or 7-seriate, obtuse, outer ovate, herbaceous, finely crispy-hairy, persistent, inner lanceolate, scarious, ciliate at the apex, falling off together with the ripe achenes. *Marginal flowers*: corolla 3—3.5 mm long; style-arms far exserted, acute; achenes nearly turbinate, brown with pale ribs, glabrous, c. 1 mm long, pappus white, 3—3.5 mm long. *Disc flowers* 2—6; corolla c. 4 mm long; finally anthers and style-arms exserted; achenes rudimentary, pappus as in marginal flowers; receptacle glabrous.

Distribution: India, Thailand, Indo-China, S. China, Japan, Malesia, N. Australia, Hawaiian Is, Christmas I., Enewetak.

NEW GUINEA. East. Milne Bay Dist.: Cape Vogel Pen., near Tapio, locally common, 1954, Hoogland 4282 (A, BRI, CANB, K, L, LAE). — Central Dist.: Domara R., bank, 1926, Brass 1593 (A, BRI, K); Kapa Kapa, 1925, Brass 807 (A, BRI, K); 5 m. N. of Kapa Kapa, 1962, Schodde 2731 (A, BO, BRI, CANB, K, L, LAE); Kapa to Kaili, MacGregor s.n. (MEL); Tupuselei, 1962, Pullen 3290 (CANB); Bootless Inlet, 1962, Pullen 3231 (CANB); Port Moresby, Goldie s.n. (MEL), 1918, White 114 (BRD); Rouku, Porebada Rd near Waigani Junction, 1969, Pulsford UPNG 163 (L); Kanosia, 1935, Carr 11011 (CANB, BM, L, NY); near Lea, ½ m. SE of Papa, 1962, Schodde 2685 (A, BRI, CANB, K, L, LAE); between Roger's Airstrip and Manu Manu, 1962, Pullen 3498 (CANB, LAE); 1½ m. E. of Delena, common, 1962, Derbyshire 794 (A, BO, BRI, CANB, K, L). — Gulf Dist.: Malalaua R., wharf near mouth of Tauri R., 1966, Schodde 4511 (L). — Western Dist.: Daru I., abundant, 1936, Brass 6216 (A, BO, BRI, L); near Dutch boundary, 1890, MacGregor s.n. (MEL); mouth of Bensbach R., 1967, Ridsdale & Galore NGF 33633 (L, LAE). — Papua. Vatorata, Turner s.n. (BRD). — West. Merauke, 1904—1956, Koch s.n. (L), McKee 1686 (L, LAE), van der Sijde

BW 4008 (CANB, L), Versteeg 1843 (BO, K, L, U); near Merauke R., Windou, 1941, Anta 143 (BO, K, L); S. and SW. New Guinea, *Zippelius s.n.* (L).

Without locality: 1880, *Chalmers s.n.* (MEL); *Reedy s.n.* (MEL).

Collectors' annotations: small tree, erect to ascending, often much branched large leafy gregarious shrub, 1.5—3 m tall; leaves (dull) light green at both surfaces, aromatic; corolla (pale) purple, purple-pink, pink-white, pink, lavender tinge, light mauve, or white; stamens deep-lilac.

Ecological notes: beaches, tidal flats, mangroves, inner edges of mangrove, coastal sand-dune scrub, brackish swamp forest, *Melaleuca* savannah swamp — monsoon forest ecotone, grasslands (sometimes inundated), ditch- and riverbanks, roadsides and old garden sites in open savannah grasslands. Altitude: 0—20 m.

9. BLUMEA

DC. in Guill., Arch. Bot. 2 (1833) 514, *nom. cons.*; Benth. & Hook. f., Gen. Pl. 2 (1873) 289; Boerl., Handl. 2 (1891) 237; Hoffmann, E. & P., Nat. Pf. Fam. 4, 5 (1894) 175; Randeria, Blumea 10 (1960) 205; Koster in Backer & Bakhu., Fl. Java 2 (1965) 387.

Herbs or undershrubs. Leaves alternate, pinninerved. Heads mostly numerous, heterogamous, many-flowered, in terminal or axillary panicles or solitary; involucre campanulate, phyllaries few- to many-seriate, imbricate, acute, outer gradually shorter, inner scarious. *Marginal flowers* numerous, many-seriate, female; corolla filiform-tubular, shortly 3-lobed; style exserted, arms linear or filiform, more or less flat, obtuse, papillose; achene small, oblong, more or less angular or subterete, ribbed, hairy, with an oblique white cartilaginous basal ring, pappus setaceous, hairs in one row, thin, finely ciliate, often caducous. *Disc flowers* bisexual; corolla infundibuliform-tubular, 5-lobed, lobes deltoid, acute; anthers sagittate, finely caudate at the base, with acuminate auricles, with an obtuse apical appendage; achene and pappus like those of marginal flowers; receptacle more or less flat or slightly convex, naked, alveolate.

Distribution: about 100 (or less) species in Africa, Madagascar, Iran, Afghanistan, India, Ceylon, Thailand, Laos, Vietnam, China, Formosa, Malesia, Solomon Is, N. Australia, New Caledonia, New Hebrides, Fiji Is.

KEY TO THE SPECIES IN NEW GUINEA

- | | |
|--|---------------------------|
| 1 a. Climbing; outmost phyllaries firm, ovate, concave | 1. <i>B. riparia</i> |
| b. Erect; outmost phyllaries herbaceous, linear-lanceolate or lanceolate | 2 |
| 2 a. Leaves elliptic or oblong, coarsely dentate, often runcinate; petiole with 1—4 pairs of appendages | 2. <i>B. junghuhniana</i> |
| b. Leaves variously shaped; petiole without appendages | 3 |
| 3 a. Uppercide of leaves densely covered with glandular hairs; underside of leaves, stem, and peduncles covered with a soft tawny-greyish woolly tomentum composed of long somewhat undulate hairs; phyllaries linear-lanceolate | 3. <i>B. arnakiophora</i> |
| b. Uppercide of leaves pubescent, scabrid, or glabrous, often glandular; underside variously pilose or subglabrous, often minutely glandular; phyllaries variously shaped | 4 |
| 4 a. Branches elongated; higher leaves semiamplexicaul; heads single or few in thin inflorescences | 4. <i>B. tenella</i> |
| b. Branches not obviously elongated; higher leaves sessile or petiolate; heads single to numerous | 5 |
| 5 a. Leaves oblanceolate, obovate-oblong, or lanceolate, remotely dentate or subentire; inflorescences thin, composed of one or few heads, branches diffuse | 5. <i>B. saxatilis</i> |
| b. Leaves variously shaped; inflorescences composed of numerous heads | 6 |
| 6 a. Leaves lanceolate, attenuate at both ends; involucre 4- or 5-seriate | 6. <i>B. stenophylla</i> |
| b. Leaves variously shaped but not lanceolate; involucre 5—8-seriate | 7 |

- 7 a. Stem dark purplish brown; leaves subcoriaceous, dark-coloured when dry; panicles pyramidal; involucre 9—10 mm long, purplish 7. *B. papuana*
 b. Stem pale or dark-coloured; leaves submembranous or chartaceous; panicles not obviously pyramidal; involucre 4—10 mm long, not purplish 8
- 8 a. Involucre 8-seriate; phyllaries elliptic-lanceolate 8. *B. arfakiana*
 b. Involucre 5- or 6-seriate; phyllaries linear-lanceolate or oblanceolate 9
- 9 a. Leaves finely remotely dentate, entire in the lower part; panicles ample, often leafy (to 45 cm long and 25 cm wide) 9. *B. sylvatica*
 b. Leaves coarsely (or rarely finely) dentate-serrate, often runcinate; panicles elongate, branches often thyrsoid, heads more or less clustered at the apex 10. *B. lacera*

I. *Blumea riparia* (Bl.) DC., Prodr. 5 (1836) 444; Boerl., Handl. 2 (1891) 239; Kitamura, Bot. Mag. Tokyo 55 (1941) 346; Koster, Blumea 6 (1948) 265; Randeria, Blumea 10 (1960) 213; Koster in Backer & Bakh., Fl. Java 2 (1965) 387. — *Conyzza riparia* Bl., Bijdr. (1826) 899, *nom. illeg.*, *non* H.B.K. (1820); Miq., Fl. Ind. Bat. 2 (1856) 51. — *Blumea semivestita* DC., Prodr. 5 (1836) 445, p.p.; Koster, Blumea 6 (1948) 265. — *Blumea pubigera* (L.) Merrill, Phil. J. Sc. 14 (1919) 250, *basionym* *Conyzza pubigera* L. *excl. fide* Craib, Fl. Siam. 2 (1936) 262; Mattfeld, Bot. Jahrb. 62 (1929) 421; Hu, Quart. J. Taiwan Mus. 18 (1965) 328.

Climbing herb or undershrub, branched, stem glabrous or scabrid, ribbed, rigid, purplish brown, 2—4 mm thick, branches oblique, often long, ribbed, purplish brown, scabrid. Leaves 0.5—8 mm petiolate, (sometimes broad) elliptic or oblong, long (sometimes short) and acutely acuminate, sometimes somewhat curved in the upper part, rounded, subacute or shortly acute at the base, dentate, scabrid or subglabrous, somewhat glossy above, shortly sparsely pilose below, chartaceous, 2—12 cm long, 1—5 cm broad, teeth 5—10 mm distant, short, deltoid or subaculeate. Panicles axillary and terminal, 3—30 cm long, on 2—6 cm long peduncles, with minute leaflike bracts at the base of the branches; heads on 3—14 mm long, slender peduncles often bearing one minute linear bract; involucre 6—8 mm long, inner phyllaries linear-lanceolate, acute, uninerved, whitish pilose in the upper part (hairs fairly long), outmost much smaller, firm, ovate, concave, obtuse, whitish pilose (hairs fairy long). Marginal flowers: corolla 4 mm long; style-arms much exserted; achene subterete, prominently ribbed, 1 mm long, sparsely pilose, pappus dingy-white, 5 mm long. Disc flowers 5—8; corolla 5 mm long, with long white hairs at the top, lobes deltoid, obtuse and shortly papillose at the apex; style exserted; achene and pappus like those of marginal flowers; receptacle more or less densely pilose around the pits, hairs white, long, erect, somewhat flexuous.

Distribution: India, Thailand, Vietnam, China, Ryukyu Is, Formosa, Malesia, Solomon Is, New Caledonia, New Hebrides.

Remark: As the name *Blumea riparia* (Bl.) DC. is based on a later homonym, it is illegitimate. The present author had not the opportunity to seek out the legitimate name as not all taxonomic synonyms have been studied.

a. forma *riparia*

Leaves oblong or elliptic, rounded, subacute, or shortly acute at the base, shortly or long-acuminate at the apex.

Distribution: as the species.

NEW GUINEA. East. New Britain: W. Nakanai, Malalai, near C. Hoskins, 1954, Floyd NGF 6604 (A, BO, BRI, CANB, L, LAE); Talasea Subdist., Mt Lollo, extinct volcano, upper slopes and top, 1959, White NGF 10849 (L, LAE). — Milne Bay Dist.: Misima I., Narian, 1956, Brass 27649 (K, L, LAE); Fergusson I., Saibutu, 1956, Brass 25944 (A, K, L, LAE); Menapi, Cape Vogel Pen., 1953, Brass 21731 (A, L,

Collectors' annotations: straggling soft shrub, scrambler, 1—5 m tall, leaves fleshy; outer phyllaries green, inner ones light greenish white; corolla (pale, greenish, ochre-, orange-) yellow, (greenish) white.

Ecological notes: climbing in trees, shrubs, and tall grasses; edges of primary forest; secondary forests, garden regrowth, along tracks, along streams. Altitude: 0—2000 m.

b. forma angustifolia Koster, *Blumea* 4 (1941) 490; *Randeria*, *Blumea* 10 (1960) 215.

Upper leaves oblong-lanceolate or lanceolate, shortly acute at the base, long attenuate at the apex.

Distribution: Malesia.

NEW GUINEA. East. Milne Bay Dist.: Normanby I., Lebudowa R., 1956, *Brass* 25539 (A, L). — E. Highl. Dist.: Buglapu, 1960, *Borgmann* 441 (L). — West. Wandammen Bay, Job I., rather common, 1962, *Schram BW* 14988 (L).

Collectors' annotations: scrambling soft shrub, leaves fleshy; corolla yellow.

Ecological notes: young secondary forest; gravelly river bank. Altitude: 40—1800 m.

2. *Blumea junghuhniana* (Miq.) Boerl., Handl. 2 (1891) 239; Koster, *Blumea* 4 (1941) 485; *Randeria*, *Blumea* 10 (1960) 235; Koster in Backer & Bakh., Fl. Java 2 (1965) 388. — *Conyza junghuhniana* Miq., Pl. Junghuhn. (1855) 449; Fl. Ind. Bat. 2 (1856) 55. — *Conyza dasycoma* Miq., o.c. 56. — *Blumea dasycoma* (Miq.) Boerl., l.c.

Large herb, stem terete, light greyish silky tomentose, afterwards glabrous, 6—10 mm thick. Leaves petiolate, elliptic or oblong, acute or subacute at the base, acute at the apex, coarsely dentate, often runcinate (teeth different in length, 1—20 mm long, obtuse or acuminate and acute), chartaceous, shortly tomentose above, densely light greyish lanate below, minutely glandular at both surfaces, 6.5—25 cm long, 2—11.5 cm broad; petiole 0.5—4 cm long, smaller in the inflorescence, light greyish silky tomentose, provided with 1—4 pairs of lanceolate appendages, 2—15 mm long. Inflorescence terminal, ample, corymbose, 20—40 cm long, 15—30 cm wide, axis light greyish silky tomentose, branches

patent, sometimes nearly perpendicular to the axis; heads in the upper half of the branches, peduncle dingy lanate, 1—4 mm long; involucre 9 mm long, phyllaries 5-seriate, linear, finely acuminate, acute, outer densely, inner thinly pilose, hairs long, white, more or less undulate. *Marginal flowers*: corolla 6.5 mm long, purplish (when dry) in the upper part; style-arms flat, obtuse; achene linear, sparsely patently pilose, 1.5 mm long, pappus tawny, 6 mm long. *Disc flowers* 5; corolla 12 mm long, purplish (when dry) in the upper part, lobes acute, glandular, with or without some rigid hairs; achene and pappus like those of marginal flowers; receptacle fimbriiferous, glabrous.

Distribution: Malesia.

New Guinea. West. Vogelkop Pen.: Ajamaroe region, Semoe, 1952, Brongersma 25 (L).

Remark: The description was prepared from Indonesian specimens, since the single specimen thusfar known from New Guinea has very young heads.

3. *Blumea arnakidophora* Mattfeld, Bot. Jahrb. 69 (1938) 286; Randeria, Blumea 10 (1960) 232. — *Blumea densiflora* auct., non DC.: Mattfeld, Bot. Jahrb. 62 (1929) 422.

Large herb or shrub, 1.1 m tall, stem 5—12 mm thick, densely covered with a soft tawny-greyish woolly tomentum, hairs long, somewhat undulate, many-celled, cells long; internodes 1—12 cm long. Leaves sessile or subpetiolate, oblong, elliptic-oblong, lanceolate-oblong, or rarely obovate-oblong, (often long-) tapering at both ends, obtuse or subacute at the apex, indistinctly or clearly mucronulate-serrate-dentate, densely covered with glandular hairs (tomentose on the nerves) above, densely covered with a soft tawny-greyish woolly tomentum (composed of long, somewhat undulate hairs) below, 8—29 cm long, 1.5—8 cm broad, in the inflorescence smaller. Panicles terminal, leafy, long, ample, 18—55 cm long, 8—15 cm wide; heads subsessile or shortly pedunculate, peduncle 2—10 mm long, densely tomentose like stem and underside of leaf; involucre 9—10 mm long, phyllaries linear-lanceolate, long-tapering, finely acuminate, more or less densely lanuginose (hairs long, appressed), ciliate at the margin of the upper part. *Marginal flowers*: corolla 5.5 mm long; style-arms filiform, obtuse, much exserted; achene prominently ribbed, 1 mm long, sparsely pilose, hairs patent, pappus tawny, 5—6 mm long. *Disc flowers* 7—18; corolla 5—6 mm long, lobes glandular, with a few white hairs on the upper part; style-arms terete, fairly short, much exserted; achene and pappus like those of marginal flowers; receptacle densely glandular around the pits, with few erect hairs.

Distribution: Borneo (Mt Kinabalu), New Guinea.

New Guinea. East. Central Dist.: near Port Moresby, 1884, Edelfeldt 42 (MEL); Boridi, 1935, Car 12991, 14536 (BM, L); Mt Tafa, abundant, 1933, Brass 4930 (A, BRI). — Morobe Dist.: Edie Creek, relatively common, 1962, van Royen NGF 16046 (CANB, L); Wau—Edie Creek Rd, 1954, Womersley & Floyd NGF 6247 (LAE); Sattelberg, 1937, Clemens 52414 (A; type, destroyed in B); Samanzing, 1938, Clemens 8959 (A); Zatarl, SE. from Boana, 1963, van Royen & Millar NGF 15686 (BRI, L); Finisterre Mts, 1880, Hellwig 298 (K, identified as *B. densiflora* by Mattfeld, 1929 l.c.). — E. Highl. Dist.: Asaro-Mairisutica Divide, Daulo Camp, 1957, Pullen 444 (BM, L, LAE); Mt Wilhelm, 1959, Brass 30502 (L), Borgmann 335 (L). — W. Highl. Dist.: Kubor Ra., Uinba, 1963, Vink 16537 (L); near Wankl, 5 km SE. of Mt Hagen Station, 1956, Hoogland & Pullen 5809 (CANB, L; in part of this collection some of the teeth of the leaves are much bigger than the other ones); Birap Lake, Lai valley near Wabag, 1960, Robbins 2903 (CANB); Poio, Yaki R. valley, 1960, Hoogland & Schodde 6796 (CANB); Kepilam, Lagaip valley, 1960, Hoogland & Schodde 7433 (L). — S. Highl. Dist.: upper Kaigel valley, Alipe Cr., Kebaka, 1962, Bowers 140 (CANB). — Sepik Dist.: Telefomin, Subdist., Oksapmin, 1968, Henty et al. NGF 41734 (L). — West. Bele R., 18 km NE. of Lake Habbema, plentiful, 1938, Brass 11081 (A, L); Wissel Lake region, Dejatej, 1939, Eyma 5187 (BO); Arfak Mts, near Minjambau, Mt Nerimbau, rather common, 1962, Koster BW 13867 (L).

Collectors' annotations: erect shrub or (woody) herb, often woody at the base, annual, single-stemmed or sparsely branched, 1—2.25 m tall, stems densely creamy woolly; leaves in a broad rosette, with a mint- or *Artemisia*-like smell when crushed; corolla yellow, yellowish, green, or yellowish white with light green lobes. *Leaves used by native women for the first 'washing' of new born babies and as diaper and toilet paper for babies.*

Ecological notes: grasslands, secondary vegetations (also on landslips), forest edges, open places in forest; gardens, roadsides; (stony, rocky) creek banks. Altitude: 1300—2700 m.

4. *Blumea tenella* DC. in Wight, Contr. Bot. Ind. (1834) 13; DC. in Decaisne, Nouv. Ann. Mus. Hist. Nat. Paris 3 (1834) 83; DC., Prodr. 5 (1836) 433; Boerl., Handl. 2 (1891) 237; Randeria, *Blumea* 10 (1960) 289; Koster in Backer & Bakhu., Fl. Java 2 (1965) 389.—*Conyza tenella* (DC.) Miq., Fl. Ind. Bat. 2 (1856) 40. — *Conyza humifusa* Miq., o.c., 41. — *Blumea humifusa* (Miq.) Clarke, Comp. Ind. (1876) 72; Boerl., Handl. 2 (1891) 237; Koster, *Blumea* 6 (1948) 265.

Small or fairly small diffuse herb, strongly branched in the lower part, 13—40 cm tall, stem somewhat grooved, (sub)glabrous, sparsely glandular, 1—4 mm thick, branches elongated, up to 40 cm long, thin, apices whitish villous; internodes 1—5 cm long. *Leaves* sessile, truncate-rotundate at the base, higher ones semiamplexicaul, lowest ones gradually attenuate to the base, all membranous or chartaceous, ovate or ovate-oblong, or oblong, acute and acuminate at the apex, finely acutely dentate, thinly pilose or glabrous above, more or less villous (especially on the nerves) below, 1.5—10 cm long, 0.3—2.5 cm broad, highest ones smaller, linear. *Heads* few, single or in thin inflorescences composed of 2 or 3 heads in the axils of the highest leaves, peduncles filiform, more or less villous, 1.5—6 cm long; involucre 6—9 mm long, phyllaries linear or lanceolate, gradually attenuate, filiform in the upper part, with a dark central line with glandular hairs and a few long flexuous white hairs. *Marginal flowers*: corolla 3.5 mm long; achene subterete, 0.75 mm long, pilose, hairs rigid, appressed; pappus 4 mm long, hairs very fine, white. *Disc flowers* c. 6; corolla 4.5 mm long; achene and pappus like those of marginal flowers; receptacle flat, afterwards somewhat convex, glabrous, somewhat fimbriate.

Distribution: Malesia, Australia.

a. var. *tenella*

Stem and branches thin, more or less flaccid. Leaves 1.5—6 cm long, 0.3—1.5 cm broad. Involucr 6—7 mm long, phyllaries linear.

Distribution: Malesia, Australia.

NEW GUINEA. East. Western Dist.: Lake Daviumbu, Middle Fly R., 1936, Brass 7837 (BM, BO, L, LAE). — West. Merauke, 1904, Koch s.n. (BO, L); Merauke Subdist., Koembe R., 10 km NE. of Koembe, 1954, van Royen 4836 (L); Vogelkop Pen., Saban, 1941, Anta 265 (A, BO, L).

Collectors' annotations: leaves yellowish green; corolla yellow or white.

Ecological notes: in grasslands, along swamp, in outskirts of *Tristania*-forest. Altitude: 4—10 m.

b. var. *luxurians* Koster, *var. nov.*

Caulis et rami rigidi. Folia 1.5—10 cm longa, 0.5—2.5 cm lata. Involucrum 8—9 mm longum, squamae lanceolatae.

Type: Robbins 2450 (CANB).

Distribution: New Guinea.

NEW GUINEA. East. Sepik Dist.: Sepik R., Wewak—Angorum area, Palumbai village, 1959, Robbins 2450 (CANB).

Ecological note: in floating grass-swamp.

5. Blumea saxatilis Zoll. & Mor., Nat. en Geneesk. Arch. N. I. 2 (1845) 243; Mattfeld, Bot. Jahrb. 62 (1929) 417; Kitamura, Bot. Mag. Tokyo 55 (1941) 344; Randeria, Blumea 10 (1960) 292; Koster in Backer & Bakh., Fl. Java 2 (1965) 389. — *Blumea virens* Martelli, Nuov. Giorn. Bot. Ital. 15 (1883) 291 (*syn. fide* Mattfeld, l.c.).

Herbs, slender, 15—84 cm tall; stem thin, ribbed, sparsely pilose (hairs mixed with glandular ones) or subglabrous, 1 mm thick, often many stems ascending from the base; internodes 2—17 cm long. Leaves sessile, lower ones sometimes subsessile, oblanceolate and tapering to the base or obovate-oblong, upper ones lanceolate, attenuate- or rounded-truncate at the base, mucronulate, often more or less rounded at the top, remotely dentate (teeth fine, sometimes deltoid and different in length) or subentire, subcoriaceous, more or less densely pubescent (hairs mixed with glandular ones) above, subglabrous or more or less densely pubescent below, 1.5—10 cm long, 0.2—3 cm broad. Inflorescence terminal, loose, thin, 6—10 cm long, composed of one or few heads, branches diffuse, slender, pilose, often long, filiform, with short linear-lanceolate bracts at the base; heads pedunculate, peduncles filiform, pilose, 2—40 mm long, rarely with a small linear bract at the base; involucre 4- or 5-seriate, 6—8 mm long, phyllaries linear-lanceolate, tapering, acute, scarious-margined, green and minutely pubescent in the middle part, outer ones short, 1 mm long. Marginal flowers: corolla 5 mm long; style-arms filiform; achene 1—1.5 mm long, pilose, pappus hairs white, 4 mm long. Disc flowers c. 6; corolla 5 mm long, lobes papillose; style-arms flattened, rounded at the apex, papillose; achene and pappus like those of marginal flowers; receptacle alveolate, glabrous.

Distribution: Thailand, Laos, Vietnam, Malesia (Java, Lesser Sunda Is, Philippines, New Guinea), Australia.

NEW GUINEA. East. Milne Bay Dist.: Sudest I., Joe Landing, 1956, Brass 27779 (L); Cape Vogel Pen., Podago, 1954, Hoogland 4319 (CANB, LAB). — Central Dist.: Rouna, 1935, Carr 12371 (BM, L); Kanosia, 1935, Carr 11310 (BM, L). — Morobe Dist.: Sattelberg, 1937, Clemens 8012a (A); Kajabit Mission, 1939, Clemens 10905 (L), 40733 (A). — W. Highl. Dist.: Mt Hagen Subdist., Pilike Kulu Swamp near Kondo, 8 m. S. of Tambul, 1969, Womersley NGF 43523 (L). — Western Dist.: Wuroi, Oriomo R., 1934, Brass 5832 (GH, NY); Arufi, Wassi Kussa R., 1968, Henty & Katik NGF 38717 (L); Lake Daviumbu, Middle Fly R., common, 1936, Brass 7887 (A, BM, BO, L, LAB). Madang Dist.: Ramu R., 1902, Schlechter 13900 (BO, K). — West. Humboldt Bay, 1875, Beccari s.n. (FI); Merauke, 1907, Koch s.n. (BO, L); Waren, 60 m. S. of Manokwari, very rare, 1940, Kanehira & Hatusima 12957 (BO).

Collectors' annotations: leaves greyish; flowers (pale) yellow, yellowish, white, or pinkish.

Ecological notes: (wet) grasslands, (open) savannah (with *Melaleuca* and *Acacia*); dry *Pteridium* association; coconut grove. Altitude: 0—480 m.

6. Blumea stenophylla Merrill, Phil. J. Sc. 29 (1926) 495; Mattfeld, Bot. Jahrb. 62 (1929) 417.

Herbs, stem thin, about 3 mm thick, subglabrous or shortly pubescent, obscurely ribbed; internodes 1—2 cm long. Leaves 0—3 mm petiolate, lanceolate, attenuate at both

ends, very acute at the apex, finely remotely dentate, subcoriaceous, pilose at both sides, minutely glandular above, 3—8 cm long, 0.4—1 cm broad. *Inflorescences* terminal, panicle, fairly dense, narrow, short, axis densely greyish pilose; heads pedunculate, peduncles filiform, densely pilose, with 1 or 2 linear bracts, densely pilose below, sparsely so above, 3—12 mm long; involucre 4- or 5-seriate, 8—10 mm long, phyllaries linear-lanceolate, tapering and acute, sparsely pilose, scarious, with a green middle line, this thin in the inner ones, outer ones short, 1.5 mm long. *Marginal flowers*: corolla 5.5 mm long; style-arms filiform; achene pubescent, 1.5 mm long, pappus hairs white, 5.5 mm long. *Disc flowers* c. 6; corolla 6 mm long, lobes glandular; style-arms flattened, rounded at the apex, papillose; achene and pappus like those of marginal flowers; receptacle alveolate, glabrous.

Distribution: Philippines, New Guinea.

NEW GUINEA. East. Central Dist.: Budatobara, 1925, Brass 756 (BRI, GH). — Western Dist.: Strickland R., 1885, Bäuerlen s.n. (MEL); branch of Fly R., 1885, Bäuerlen 36 (MEL).

Collectors' annotation: 45—75 cm tall.

Ecological note: river banks; savannah. Altitude: 90 m.

Remarks: Some differences are found between Merrill's description of this species and the New Guinea specimens. From Merrill's description the inflorescences appear to be loose and the involucre only 5—6 mm long, in the New Guinea specimens the inflorescence is fairly dense and the involucre is 8—10 mm long. However, in several Philippine specimens in the Rijksherbarium — by the present author also brought to *Blumea stenophylla* on account of the lanceolate leaves — the inflorescences are fairly dense and the involucre is about 8 mm long. No type specimen was available.

7. *Blumea papuana* S. Moore, Trans. Linn. Soc., Bot. 9 (1916) 84; Mattfeld, Bot. Jahrb. 62 (1929) 422; Randeria, Blumea 10 (1960) 217.

Tall branched or unbranched herb, stem dark purplish brown when dry, 4—9 mm wide, ribbed, shortly pilose, glandular. *Leaves* 2—10 mm petiolate, elliptic or elliptic-oblong, acute, often tapering at the base, shortly acuminate and acute at the apex, acutely mucronulate-dentate (teeth acuminate), subcoriaceous, shortly appressed-pubescent at both sides, when dry dark coloured above, lighter coloured, minutely glandular below, 2.5—15 cm long, 1—4.5 cm broad, smaller in the inflorescence. *Panicles* terminal, leafy, ample, pyramidal with thyrsoid, often long (up to 30 cm) branches, 10—50 cm long, 5—45 cm wide; heads solitary or clustered in the upper part of the branches, sessile or on 2—3 mm long peduncles, with a short linear bract; involucre 6- or 7-seriate, 9—10 mm long, phyllaries lanceolate, tapering, acute, appressed-pubescent on the midrib and in the upper part, sparsely ciliate at the margin. *Marginal flowers*: corolla 6 mm long; style-arms fairly short; achene angular and prominently ribbed, appressed-pubescent, 1 mm long, often somewhat curved, pappus 6 mm long, dingy white. *Disc flowers* 5—8; corolla 6 mm long; achene and pappus like those of marginal flowers; receptacle glandular, shortly pilose around the pits.

Distribution: New Guinea.

NEW GUINEA. East. Milne Bay Dist.: Mt Dayman, one specimen, 1953, Brass 22871 (A). — Central Dist.: Iolo Creek, Lake Myola, 1964, Gillison 338 (L, LAE); Mt Tafa, common, 1933, Brass 4931 (A, BO, BRI). — Morobe Dist.: Edie Creek, 1962—1969, van Royen NGF 16047 (L), Streimann NGF 44454 (L), Streimann & Kairo NGF 21069 (L, LAE); Sattelberg, Sambanga, 1937, Clemens 7611 (A, L). — W. Highl. Dist.: Tomba, S. slope of Mt Hagen, 1956, Hoogland & Pullen 6004 (CANB, L, LAE). — S. Highl. Dist.: Mendi Subdist., Kaguba, 1968, Vanderberg et al. NGF 39811 (L). — Madang Dist.: Dumpu, 1964, Henty

& Sayers NGF 20525 (L). — West. Bele R., 18 km NE. of Lake Habbema, common, 1938, Brass 11566 (A, L); 9 km NE. of Lake Habbema, 1938, Brass 10558, 10892 (A, L); Treub Mts, 1913, Pulle (leg. Versteeg) 1098 (BO, GH, L, identified by Mattfeld).

Collectors' annotations: erect tall woody (annual) herb, with several stems, 1—2 m tall, whole plant or parts of it purplish red or purplish brown, leaves dark green, glossy above, paler below; phyllaries (brown-) purple; corolla (orange-) yellow or red.

Ecological notes: open places (trails) in wet forest; old landslides; secondary growth; grasslands; roadsides, along streams; on slate. Altitude: 300—2750 m.

Remarks: The type of *Blumea papuana* — Mt Carstensz, 1912—1913, Kloss s.n. (BM) — was not seen by the author. Mattfeld saw a fragment of it (B). However, for comparison a specimen of this endemic and characteristic species, identified by Mattfeld, was available.

8. *Blumea arfakiana* Martelli, Nuov. Giorn. Bot. Ital. 15 (1883) 292; Boerlage, Handl. 2 (1891) 239; Mattfeld, Bot. Jahrb. 62 (1929) 424; Kitamura, Bot. Mag. Tokyo 55 (1941) 344; Randeria, Blumea 10 (1960) 220. — *Blumea aromatica* auct., non DC.: Warburg, Bot. Jahrb. 13 (1891) 446; Lauterbach, Nova Guinea 8, 2 (1910) 336; 8, 4 (1912) 864. — *Blumea balfourii* Hemsl. var. *papuana* S. Moore, Trans. Linn. Soc., Bot. 9 (1916) 84.

Tall herb or shrub, 50—80 cm tall or taller, stem ribbed, densely minutely glandular, sparsely shortly appressed-pubescent, 3—8 mm thick; internodes 2—8 cm long. Leaves sessile or nearly so, broadly elliptic, oblong- or obovate-elliptic, spatulate- or obovate-oblong, long-tapering at the base, shortly or fairly long-tapering, acute and mucronulate at the apex, shortly or minutely mucronulate-dentate, chartaceous, scabrid above, sparsely (on the nerves more or less densely) pubescent, densely minutely glandular below, 11—35 cm long, 3—11 cm broad. Inflorescence mostly terminal, ample, loose, 20—60 cm long, 10—30 cm wide, sometimes axillary and much smaller, branches pilose, bearing heads in the upper part, with leaf-like narrowly elliptic-oblong or linear bracts at the base; heads pedunculate, peduncles 2—8 mm long, thin, more or less densely pilose, bearing 1—3 minute linear bracts; involucle 8-seriate, 9—10 mm long, squarrose when dry, phyllaries elliptic-lanceolate, glandular, pubescent especially in the upper part, subcoriaceous, rigid, with pale margins, outer short, 2—3 mm long, with fimbriate margins, shortly acuminate, inner long-acuminate. Marginal flowers: corolla 8 mm long; style-arms filiform; achene 1.5 mm long, prominently ribbed, fairly long patently whitish pilose, pappus whitish, 6 mm long. Disc flowers 2—8; corolla 8 mm long; style-arms short, flattened, rounded at the apex, papillose; achene and pappus like those of marginal flowers; receptacle glabrous.

Distribution: Moluccas, Aru Is, New Guinea, Bismarck Arch., Solomon Is, Palau Is, Samoa Is.

NEW GUINEA. East. Milne Bay Dist.: Normanby I., Lebudowa R., occasional, 1956, Brass 25538 (A, L); Mt Dayman, 1953, Brass 23523 (L, LAE). — Central Dist.: Mt Musgrave, 1889, MacGregor 29 (MEL). — Morobe Dist.: 'Kaiser Wilhelmsland', 1889, Hellwig 490 (BO, K); Finschhafen, 1889, Warburg 21411 (A); Mongi valley, N. of Pindiu, 1964, Hoogland 8854 (L); Burep R., NE. of Lae, 1962, Hartley 10155 (L); Bumbu R., 10 m. from Lae, 1963, Womersley NGF 17608 (BRI, L, LAE); Boana, 1940, Clemens 41792 (A), 1962, Henty NGF 14732 (L); Supot, near Boana, 1962, Henty NGF 14737 (L). — Western Dist.: branch of Fly R., 1889, Bäuerlen 48 (MEL); Palmer R., near junction Black R., 1936, Brass 7306 (BRI, L). — Madang Dist.: foot Mt Hellwig, Puria R., fairly common, 1955, Hoogland 5203 (CANB, L, LAE); slope below Aiome airstrip, 1968, Coode & Katik NGF 32828 (L). — Sepil Dist.: Aitape Subdist., Bliri R., Kaiye, 1961, Darbyshire & Hoogland 8239 (L). — West. Hollandia Dist.: Begowrie R., 40 km SE. of Hollandia, dispersed in small groups, 1910, Gjellerup 238 (BO, L); Cyclops Mts, foothills E. of Koejaboe R., common, 1954,

van Royen 4472 (L, LAE); Idenburg R., near Bernhard Camp, 1939, *Brass* 13068 (A, L); Rouffaer R., 1926, *Docters van Leeuwen* 10072 (BO, L, U); Setakwa R., Canoe Camp, 1912—1913, *Kloss s.n.* (K, type of *Blumea balfourii* Hemsl. var. *papuana* S. Moore); Tor R., 1911, *Gjellerup* 717 (BO). — Southern Dist.: along Lorentz R. (Noord R.), 1907—1912, *von Römer* 167 (BO, L), 301 (L), 958 (L), *Versteeg* 80 (BO, L), 107, (BO, L), 1057 (BO, L, U), 1501 (BO, L, U). — Geelvink Bay Dist.: Napan Subdist., Akama, 1943, *Ijiri & Niimura* 428 (L), 429 (TNS); ibidem, Watu, 1943, *Ijiri & Niimura* 69 (TNS); Japen I., Mentemboe, 1939, *Aet & Idjan* 72 (L). — Vogelkop Pen.: Arfak Mts, Putat, 1872, *Beccari* 843 (FI, type). — Misool I.: near Fakal, scanty, 1948, *Pleyte* 1072 (L).

Collectors' annotations: perennial, herbaceous, half-woody herb, (sub)-shrub, 1.2—3 m tall; stems slightly sticky; leaves yellowish green, dull mid-green, or pale green above, grey-green, paler below; corolla (pale, dull, rusty, white-) yellow, yellowish, light green, greenish; aromatic (with smell of *Artemisia*).

Ecological notes: along (gravelly, rocky) banks of rivers and creeks; fallow gardens; (open places in) forests; *Saccharum* thickets; roadsides. Altitude: 0—900 (—1350) m.

9. *Blumea sylvatica* (Bl.) DC., Prodr. 5 (1836) 447; Clarke, Comp. Ind. (1876) 90; Boerl., Handl. 2 (1891) 239; Merrill, Enum. Phil. 3 (1923) 605; Mattfeld, Bot. Jahrb. 62 (1929) 423; Randeria, *Blumea* 10 (1960) 223; Koster in Backer & Bakh., Fl. Java 2 (1965) 389.

Large erect herb, 75—175 cm tall, stem 5—10 mm thick, tomentose, pubescent, or rarely glabrous; internodes 4—13 cm long. Leaves often distant, subsessile or 0.5—1.5 cm petiolate, (often narrowly) elliptic-oblong or obovate-oblong, long (rarely shortly) tapering at the base and at the acute apex, finely remotely dentate (teeth thick, often several ones larger), lowest part entire, chartaceous or submembranaceous, thinly (more densely on the nerves) pubescent on both surfaces, or greyish or pale brownish (hairs erect) tomentose below, minutely glandular on both surfaces, including petiole 6.5—25 cm long, 1.5—9 cm broad, in the inflorescence smaller and narrower (up to 45 cm long and 18 cm broad in specimens from Indonesia). Heads in terminal, large, ample, usually leafy panicles up to 45 cm long and 25 cm wide, with a pilose glandular axis bearing leaflike pilose bracts; heads pedunculate, peduncles thin, 3—15 mm long, often with 1 or 2 minute linear bracts; involucre 7—10 mm long, 6-seriate, phyllaries linear-lanceolate, finely acuminate, acute and pilose at the top, uninerved, outer appressed-pubescent, minutely glandular, inner pubescent on the midrib and on the top. *Marginal flowers*: corolla 5.5 mm long, with or without a few long hairs, with scarce minute glandular hairs in the upper part; achene 1 mm long, narrowly oblong, prominently ribbed, whitish pubescent, pappus hairs 6 mm long, dingy or reddish when dry. *Disc flowers* 3—20; corolla 5.5—6 mm long, lobes pilose (hairs few, fairly long), glandular; anthers exserted; achene and pappus like those of marginal flowers; receptacle more or less obviously fimbriate, variously pilose (hairs fairly long or short, many or few) or (sub)glabrous.

Distribution: India, Malesia, Solomon Is.

Remarks: This species is very variable as to shape and pubescence of the leaves, pubescence of the receptacle, and number of the disc flowers.

Blumea milnei Seem. was mentioned by Mattfeld (l.c.) to occur in the Bismarck Archipelago. He had the occasion to study the type of this species. The specimens concerned have not been seen by the present author. Although mentioning slight differences, Mattfeld brought two New Guinea specimens (Janowski 369, Versteeg 1649) to *Blumea milnei*; here they are transferred to *B. sylvatica*. The same applies to *von Römer* 869, considered by Randeria (o.c., p. 231) to belong to *B. milnei*.

B. milnei seems to be much allied to *B. sylvatica* and differs, according to the description

and the figure of Seem., Fl. Vitiens. (1865—1868), 141, t. 27, by the elliptic or obovate broader leaves and the sessile heads, glomerate in the upper part of the branches.

a. var. *sylvatica* — *Conyzia sylvatica* Bl., Bijdr. (1826) 898; Miq., Fl. Ind. Bat. 2 (1856) 50. — *Conyzia sessilifolia* Bl., o.c., 897. — *Blumea sessilifolia* (Bl.) DC., Prodr. 5 (1836) 447. — *Blumea macrophylla* (Bl.) DC. var. *sylvatica* (Bl.) Koster, Blumea 4 (1941) 488.

Upper leaves thinly pubescent below, more densely so on the nerves; disc flowers 3—8 in a head.

Distribution: throughout Malesia, Solomon Is.

NEW GUINEA. East. Bougainville Dist.: Buin Subdist., Tonolei Harbour, 1969, Coode et al. NGF 40418 (L). — Milne Bay Dist.: Mt Dayman, 1953, Brass 23331 (A, L, LAE). — Northern Dist.: Mt Gaugun, 1959, Cruttwell 1109 (K). — Central Dist.: Boridi, 1935, Carr s.n. (BM). — Morobe Dist.: Mt Sarawaket, 1937, Clemens 5678 (A). — E. Highl. Dist.: Mt Wilhelm, 1960—1968, van Balgooy 691 (L), Borgmann 202 (L), Philipson 3410 (L). — W. Highl. Dist.: Kubor Ra., S. of Minj, 1963, Pullen 5371 (L); Baiyer—Jimmy Divide, Dagarunga Ridge, 1968, Henty & Streimann NGF 38867 (L). — S. Highl. Dist.: Mt Giluwe, above Klareg, 1961, Schodde 1973 (L); Mendi Subdist., Mendi Rd, 1968, Vandenberg et al. NGF 39736 (L); Ibiwara, Tari Gap, 1966, Gillison NGF 25163 (L, LAE); Wasemi, Lake Kutubu, 1961, Schodde 2308 (L). — Madang Dist.: Finisterre Mts, between Sewe and Mt Abilala, 1964, Pullen 6053 (L); ibidem, Sewe, 1964, Sayers NGF 21385 (BM, L). — Sepik Dist.: Telefomin Subdist., Oksapmin, 1968, Henty et al. NGF 41733 (L). — West. Mt Hellwig, summit, 1909, von Römer 869 (L, det. Lauterbach: *B. milnei* Seem.); Noord R., Resi Mts, 1907, Versteeg 1649 (BO, L, U, det. Lauterbach: *B. milnei* Seem.); S. New Guinea, 1909, von Römer 983 (L, det. Randeria: *B. bicolor* Merr.); S. and SW. New Guinea, 1828, Zippelius s.n. (L, det. Randeria: *B. korthalsiana* (Miq.) Boerl.); Geelvink Bay Dist., Jabi Mts, Wappe, 1913, Janowsky 369 (BO).

Collectors' annotations: erect simple herb, (small) shrub, 1.2—4 m tall; branches of inflorescence angled up; leaves (dull) dark green above, light green below, or mid grey-green on both sides, aromatic, with a slight mint- or *Artemisia*-like smell when crushed; flowers (pale) yellow, creamy, green, greenish brown, yellowish green, or yellowish cream.

Ecological notes: lowland to montane forests or forest edges; along streams; bog grasslands; abandoned gardens; on muddy soil. Altitude: 240—3000 m.

Remark: The types of *Conyzia sylvatica* Bl. and *Conyzia sessilifolia* Bl., both in the Rijksherbarium, Leiden, have been studied by the author.

b. var. *macrophylla* (Bl.) Randeria, Blumea 10 (1960) 228; Koster in Backer en Bakh., Fl. Java 2 (1965) 389. — *Conyzia macrophylla* Bl., Bijdr. (1826) 896; Miq., Fl. Ind. Bat. 2 (1856) 53. — *Blumea macrophylla* (Bl.) DC., Prodr. 5 (1836) 446; Clarke, Comp. Ind. (1876) 88; Boerl., Handl. 2 (1891) 238; Koster, Blumea 4 (1941) 485. — *Conyzia ternatensis* Miq., o.c., 49. — *Blumea ternatensis* (Miq.) Boerl., o.c., 239.

Upper leaves densely greyish tomentose below; disc flowers 3—8 in a head.

Distribution: India (Pegu), Malesia (Java, Lesser Sunda Is, Celebes, Moluccas, New Guinea).

NEW GUINEA. East. Morobe Dist.: Bulolo, 1950, Fryer 4030 (A, CANB, LAE); Sattelberg, 1935, Clemens 946 (L), 1936, Clemens 3019 (Z). — E. Highl. Dist.: Goroka Subdist., Chimbu Divide, Daulo Rd Camp, 1954, Womersley et al. NGF 6084 (LAE). — W. Highl. Dist.: Nondugl, 1951, Gyladenstolpe s.n. (S); Lagaip R., Kepilam, 1960, Hoogland & Schodde 7357 (CANB, this specimen is slightly different by the leaves which are shortly attenuate to the base). — West. Hollandia Dist.: Doorman R., 1920, Lam 1294 (BO); Balem R., 1938, Brass 11656 (A, L, identified as *B. arfakiana* Martelli by Randeria, o.c., 221). — Vogelkop Pen.: Aifat R., Surerem, 1961, van Royen & Sleumer 6743 (L).

Collectors' annotations: erect herb or subshrub, single-stemmed or bushy, 1—3.5 m tall; leaves light green above, light grey below; flowers (greenish) yellow.

Ecological notes: gravelly or sandy banks of streams in forest or in grassland; secondary growth; gardens. Altitude: 200—2400 m.

Remarks: The types of *Conyza macrophylla* Bl. and *Conyza ternatensis* Miq., both in the Rijksherbarium, Leiden, have been studied by the author. Randeria considers the acuminate phyllaries and the glabrous receptacle in this variety to be good characters to distinguish it from var. *sylvatica*. The present author found the phyllaries of both varieties to be acuminate and acute, whereas the receptacle can be glabrous as well as pilose in both varieties. Blume mentioned in his description of *Conyza macrophylla* the underside of the leaves to be greyish tomentose.

c. var. *pachycephala* (Koster) Koster, nov. comb. et stat. — *Blumea pachycephala* Koster, *Blumea* 4 (1941) 487, f. 3; Randeria, *Blumea* 10 (1960) 221; Koster in Backer & Bakhu., *Fl. Java* 2 (1965) 388.

Upper leaves thinly pubescent below, more densely so on the nerves; disc flowers 10—20 in a head.

Distribution: Java, New Guinea.

NEW GUINEA. West. Hollandia Dist.: Bele R., 18 km NE. of Lake Habbema, common, 1938, *Brass* 11565 (A, L). — Wissel Lake Region: near bivak Kebon, 1939, *Eyma* 5320 (A, BO, BRI, L); Bogesiga—Araboe bivak, 1939, *Eyma* 5399 (BO). — Vogelkop Pen.: Arfak Mts, Mt Lehuma, 1928, *Mayr* 127 (BO).

Collectors' annotations: woody annual, up to 2 m tall; flowers yellow.

Ecological notes: in grassy regrowth of old garden. Altitude: 2200 m.

10. ***Blumea lacera* (Burm. f.) DC.** in Wight, Contr. Bot. Ind. (1834) 14; Prodr. 5 (1836) 436; Clarke, Comp. Ind. (1876) 76; Hook. f., Fl. Br. Ind. 3 (1881) 263; Boerl., Handl. 2 (1891) 238; White, Proc. R. Soc. Qld 34 (1922) 60; Ridley, Fl. Mal. Pen. 2 (1923) 193; Merrill, Enum. Phil. 3 (1923) 602; Gagnepain, Fl. Gén. I.-C. 3 (1924) 539; Mattfeld, Bot. Jahrb. 62 (1929) 420; Randeria, *Blumea* 10 (1960) 264; Koster in Backer & Bakhu., *Fl. Java* 2 (1965) 390; Hu, Quart. J. Taiwan Mus. 18 (1965) 325. — *Conyza lacera* Burm. f., Fl. Ind. (1768) 180, t. 59 f. 1; Miq., Fl. Ind. Bat. 2 (1856) 42. — *Blumea lactucaefolia* DC., Prodr. 5 (1836) 435; Hook. f., o.c. 672; Boerl., l.c. — *Blumea runcinata* DC., Prodr. 5 (1836) 438; Miq., o.c. 46; Clarke, o.c. 78, Koster, *Blumea* 6 (1948) 265.

Erect herb, 20—100 cm tall, stem often simple but sometimes much branched, ribbed, sparsely villous all over or densely so in the upper part or subglabrous, minutely glandular, 3—7 mm thick; internodes 2—7 cm long. Leaves sessile or subpetiolate, shortly acuminate, acute or sometimes nearly rounded at the apex, coarsely or finely dentate-serrate or dentate (teeth often much different in size), chartaceous or submembranous, minutely glandular on both surfaces, sparsely or densely whitish villous, somewhat scabrid above, more or less densely whitish villous below, higher ones elliptic- or spatulate-oblong or elliptic, truncate at the base, lower ones obovate-oblong, shortly or long-tapering at the base, or lyrate, often runcinate, sometimes subrosulate at the base; leaves 2—21 cm long, 0.5—13.5 cm broad, upper ones smaller. Panicles terminal or axillary, thin, elongate, branches often thyrsoid, heads more or less clustered at the apex, axis and branches villous, lowest branches in the axils of small leaves; heads pedunculate, peduncles villous, 2—35 mm long, often with a minute bract; involucre often purple, 4—10 mm long, 5- or 6-seriate, phyllaries whitish or dingy villous, minutely glandular, with dark-coloured middle line, outer oblanceolate, finely acuminate, acute, inner lanceolate-

linear, acuminate, acute, finely serrate in the upper part. *Marginal flowers*: corolla 4—4.5 mm long, slightly differing in length; achene c. 1 mm long, angular, ribbed, somewhat patently pilose, pappus 4—5 mm long, whitish. *Disc flowers* 8—30; corolla 4—5.5 mm long, lobes acute, glandular, often pilose in the upper part; anthers not or hardly exserted; achene and pappus like those of marginal flowers; receptacle slightly convex, fimbriate, glabrous or sparsely or densely whitish pilose.

Distribution: Africa, India, Thailand, Cambodia, Vietnam, China, Japan, Formosa, Malesia, Solomon Is, Marianas, Australia, New Caledonia.

Remark: Several authors have already mentioned the wide variability of *Blumea lacera*; this is evident in the habit, the leaves, the inflorescence, and the pubescence.

a. var. *lacera* — *Conyza lacera* Burm. f. — *Blumea lacera* var. *burmannii* DC. et var. *commersonii* DC., Prodr. 5 (1836) 436. — *Conyza acrocephala* Miq., Fl. Ind. Bat. 2 (1856) 43.

Upper part of stem, axis and branches of inflorescence more or less densely whitish or tawny villous. Leaves more or less densely whitish villous below, 0.5—5.5 cm broad. Panicles elongate, narrow, heads congested in the upper part of the branches, often glomerate; involucre 7—8 mm long.

Distribution: as the species.

New Guinea. East. without loc., Lawes s.n. (MEL); SE. New Guinea, 1885, Chalmers s.n. (MEL). — Milne Bay Dist.: Cape Vogel Pen., Menapi, scattered, 1953, Brass 21763 (A, L, LAE, det. Randeria: *B. hieracifolia* (Don) DC.). — Northern Dist.: Moi Biri Bay, Baiawa, occasional, 1953, Brass 22165 (A, L). — Central Dist.: Sowehfaja, Wanigela, near Taipo, fairly common, 1954, Hoogland 4290 (A, BM, CANB, L, LAE); Vanapa R., Urumu, sporadic, 1933, Brass 4818 (BO, GH); Aroa R., 1885, Armit 15 (MEL). — Morobe Dist.: Bululo, 1950, Fryar 3646 (BM, BO, CANB, L, LAE); Baiune, 1959, Henty NGF 11641 (LAE); Lake Wanum, 1963, Henty 16664 (CANB, L); Oomsis, foot of Red Hill, 1962, Womersley NGF 14190 (L); Finschhafen, 1889, Warburg 21410 (A, det. Mattfeld: *B. hieracifolia*), Weinland 41 (BO); Kajabit Mission, 1939, Clemens 10479 bis (A), 10890 (A), 40701 (MICH); Erap, 1959, Henty NGF 11591 (L, LAE); Boana, 1940, Clemens 41773 (MICH). — E. Collectors' annotations: 1.2—2 m tall; aromatic, with a strong *Artemisia*-odour; stem (dark) purple or red; lower side of leaves purple; involucre dark red or purple at the apex; corolla (light, bright, reddish) yellow (and purple), later purple; anthers yellow, yellowish brown; style (bright) yellow, of disc flowers later white with purple.

Ecological notes: dry to swampy grasslands, savannah woodland; along streams; gardens; on clay, sandy soil, rocky soil, granite rocks. Altitude: 1—2905 m.

R e m a r k s: Judging from Wight, Ic. Pl. Ind. Or. 3 (1846) t. 1099, *Blumea hieracifolia* (D. Don) DC. in Wight, Contr. Bot. Ind. (1834) 15; Prodr. 5 (1836) 442, would not be different from *Blumea lacera* var. *lacera*. Also, specimens identified by Warburg, Bot. Jahrb. 13 (1891) 445, Lauterbach, Fl. Deutsch. Schützgeb. Südsee (1901) 598, Mattfeld, Bot. Jahrb. 62 (1929) 419, Randeria, *Blumea* 10 (1960) 246, and Koster in Backer & Bakh., Fl. Java 2 (1965) 390 as *Blumea hieracifolia* are considered by the present author to belong to *Blumea lacera* var. *lacera*.

In her key to the species of *Blumea*, Randeria (o.c., p. 207) points out that the outer phyllaries should be linear and tapering in *B. lacera*, whereas they should be oblong-lanceolate and acute in *B. hieracifolia*. In his Prodromus, De Candolle described the phyllaries of both species as linear and acuminate. He states the number of disc flowers to be 5 in *B. hieracifolia* and about 20 in *B. lacera*. The present author has found that number to be highly variable in *B. lacera*: 8—20.

White, Proc. R. Soc. Qld 34 (1922) 60, also mentions *B. hieracifolia* from New Guinea (Yule I.).

b. var. blumei DC., Prodr. 5 (1836) 436. — *Conyzia javanica* Bl., Bijdr. (1826) 897. — *Blumea javanica* (Bl.) Zoll., Flora 30 (1847) 531. — *Blumea lacera* (Burm. f.) DC. var. *javanica* (Bl.) Koster, *Blumea* 4 (1941) 488. — *Conyzia laciniata* Roxb., Fl. Ind. (1832) 601. — *Blumea laciniata* (Roxb.) DC., Prodr. 5 (1836) 436; Hook. f., Fl. Br. Ind. 3 (1881) 264; Boerl., Handl. 2 (1891) 238; Warburg, Bot. Jahrb. 13 (1891) 445; Lauterbach, Nova Guinea 8 (1910) 336; Merrill, Enum. Phil. 3 (1923) 602; Gagnepain, Fl. Gén. I.-C. 3 (1924) 532; Randeria, *Blumea* 10 (1960) 258; Koster in Backer & Bakh., Fl. Java 2 (1965) 388. — *Blumea cichoriifolia* DC. ex Decaisne, Nouv. Ann. Mus. Hist. Nat. Paris 3 (1834) 410; DC., Prodr. 5 (1836) 437; Hook. f., Fl. Br. Ind. 3 (1881) 672. — *Conyzia cichoriifolia* Miq., Fl. Ind. Bat. 2 (1856) 47. — *Blumea sinapifolia* Gagnepain, Bull. Soc. Bot. Fr. 68 (1921) 43; Fl. Gén. I.-C. 3 (1924) 536; Mattfeld, Bot. Jahrb. 62 (1929) 418 (with syn. *B. lactucaefolia* Martelli, Nuov. Gior. Bot. Ital. 15, 1883, 290).

Upper part of stem sparsely villous. Leaves sparsely villous or shortly pilose on both surfaces, 0.5—13.5 cm broad. Panicles loose, sometimes ample; involucle 5—8 mm long.

D i s t r i b u t i o n: Africa, India, Thailand, Cambodia, Vietnam, China, Malesia, Solomon Is., Marianas, Australia, New Caledonia.

N E W G U I N E A . E a s t. New Britain: 1885, *Parkinson* 14 (MEL); Bismarck Arch., 1889, *Warburg* 2147 (A). — Milne Bay Dist.: Sudest I., Rambuso, 1953, *Brass* 28210 (A, L, LAE); South Cape, 1877, *Chalmers s.n.* (MEL); Cape Vogel Pen., Menapi, occasional, 1953, *Brass* 22044 (A, L, LAE). — Northern Dist.: Kwagira R., Peria Creek, one plant, 1953, *Brass* 24288 (A, L). — Morobe Dist.: 4 m. S. of Langemak Bay near Finschhafen, 1945, *Sawyer* 102, 105, 183 (A); vicinity Finschhafen, 1945, *Sawyer* 279 (L); Adler (=Busu) R., 1890, *Lauterbach* 672 (L); Abunaka Plantation near Lac, 1967, *Henty NGF* 29166 (L); Mt Sarawaket, 1937, *Clemens* 5679 (A); Kajabit Mission, 1939, *Clemens s.n.*, 40643 (A.). — **W e s t.** Hollandia Dist.: Arso R., upper Tami R., 1910, *Gjellerup* 17 (BO, L); Rouffaer R., 1926, *Docters van Leeuwen* 9748 (BO, det. Mattfeld: *B. sinapifolia*); Nassau Ra., 1926, *Docters van Leeuwen* 10600 (BO, L, det. Mattfeld: *B. sinapifolia*). — Southern Dist.: Lorentz R., near Maukeba, 1912, *Pulle* 258 (BO, det. Mattfeld: *B. sinapifolia*); Alkmaar, 1907, *Versteeg* 1499 (BO, L). — Vogelkop Pen.: Arfak Mts, Anggi Lakes, Kofo, 1928, *Mayr* 228 (BO, det. Mattfeld: *B. sinapifolia*); Wasior, 1928, *Mayr* 420 (BO, det. Mattfeld: *B. sinapifolia*); Kebar Valley, Andjai, rather common, 1961, *van Royen & Sleumer* 6758 (L); Sorong, 1872, *Beccari* 147 (Fl.). — **W i t h o u t l o c a l i t y:** 1896, *Lauterbach* 860 (K).

C o l l e c t o r s' a n n o t a t i o n s: 1.2 m tall; young parts of inflorescence strongly pungent-aromatic.

E c o l o g i c a l n o t e s: (marshy, *Imperata*-) grasslands; woodland-grass; sandbank

in creek, open place on riverbank; native gardens, recently cleared land; stone bank, loamy soil. Altitude: 10—1900 m.

R e m a r k s: Though small plants of *Blumea lacera* var. *blumei* with thin pubescence and small heads are easily separated from var. *lacera* — which would justify the distinction of two species — numerous specimens out of the great number available were found to be forms transitional between the varieties concerned.

c. var. *meraukensis* Koster, *Blumea* 4 (1941) 489.

Upper part of stem and leaves sparsely villous. Higher leaves spatulate-oblong, coarsely dentate. Panicles loose, elongate; involucle 4—5 mm long.

D i s t r i b u t i o n: New Guinea.

N E W G U I N E A. West. Merauke, 1904, *Koch s.n.* (BO, L); ibidem, 1907, *Versteeg* 1844 (BO, L).

C o l l e c t o r s' a n n o t a t i o n s: Involucrum reddish brown; corolla white or yellow.

E c o l o g i c a l n o t e s: in grassy plain, in *Imperata*-fields.

d. var. *subdivaricata* Koster, *nov. var.*

Pars superior caulis dense villosa. Folia firma, subtus dense vel sparse villosa. Paniculae subdivaricatae, capitula congesta in apice ramorum elongatorum, usque ad 30 cm longiorum; involucrum 8—10 cm longum.

T y p e: *Hoogland & Schodde* 7450 (L).

D i s t r i b u t i o n: New Guinea.

N E W G U I N E A. East. Morobe Dist.: Wantoat, 1940, *Clemens* 41082 (A). — W. Highl. Dist.: Laiagam Subdist., Yobobos grassland area, source of Lagaip R., 1960, *Hoogland & Schodde* 7450 (L, type); Lake Iviva, abundant, 1965, *Flenley ANU* 2499 (CANB, L). — S. Highlands Dist.: Mt Giluwe, above Klareg, 1961, *Schodde* 2083 (L).

C o l l e c t o r s' a n n o t a t i o n s: 0.8—1.5 m tall; corolla yellow.

E c o l o g i c a l n o t e s: bog-grasslands, *Mischanthus*-grasslands; low shrubbery. Altitude: 2460—2640 m.

R e m a r k: The habit of this variety is different from most specimens of var. *lacera* to which variety it is nearest. However, there are specimens, brought to var. *lacera* here, with branched inflorescences which only differ by the shorter branches of the panicles.

DUBIOUS RECORDS

The following taxa have been reported for New Guinea, but they have not been incorporated as the specimens concerned were either too scanty or destroyed or lost.

Blumea balsamifera* (L.) DC. var. *macrocephala Kitamura, *Bot. Mag. Tokyo* 55 (1941) 344; was described from: Waren, 1940, *Kanehira & Hatusima* 13210.

Blumea bicolor Merrill was reported for New Guinea by Randeria, *Blumea* 10 (1960) 231. This was based on *von Römer* 983, a fairly fragmentary specimen brought to *B. sylvatica* var. *sylvatica* by the present author, though its leaves are somewhat different by a shortly acuminate apex.

Blumea subalpina Lauterbach, Fedde Repert. 13 (1915) 241; was described from: Finisterre R.a., Mt. Bolan, 1912, Keysser 310, 2200—3000 m alt. Mattfeld saw the type and reports in Bot. Jahrb. 62 (1929) 422 that the inflorescences were too young to recognize the species well.

Blumea vanoverberghii Merrill was mentioned by Mattfeld, Bot. Jahrb. 62 (1929) 420, to occur in New Guinea.

Blumea vestita Kitamura, Bot. Mag. Tokyo 55 (1941) 345, was described from the Arfak Mts, Anggi Lakes, near Lake Giji, fringing forest along Iray R., 1940, Kanehira & Hatusima 13893, 1900 m alt.

6. HELENIEAE

Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 251.

Leaves alternate or opposite, often pinnatifid, sometimes simple, sometimes glandular. Heads homogamous or heterogamous. Marginal flowers female, mostly fertile; corolla mostly ligulate, rarely shortly tubular, bilabiate, or wanting. Disc flowers bisexual, mostly fertile, sometimes interior ones or all sterile; corolla tubular, 4- or 5-dentate; style two-armed; pappus setaceous, or consisting of scales, or wanting; receptacle naked or sometimes pilose.

I. TAGETES

L., Spec. Pl. (1753) 887; Benth. & Hook. f., Gen. Pl. 2 (1876) 411; Hoffmann, E. & P., Nat. Pfl. Fam. 4, 5 (1894) 265.

Herbs, erect, annual or perennial, strongly smelling when bruised. Leaves alternate or opposite, dentate-serrate, with translucent glands. Heads solitary or corymbose, terminal, pedunculate, radiate; involucle cylindric or campanulate; phyllaries uni-seriate, dentate at the apex, connate by their margins, with translucent yellow or orange glands. Marginal flowers uni-seriate; corolla ligulate, with a rather long tube and an obovate ligule; style-arms filiform, subobtuse or subacute, glabrous. Disc flowers numerous; corolla infundibuliform-tubular, with 5 acute teeth, pubescent at the margins; anthers shortly sagittate at the base, acute at the apex; style-arms rather long, subacute, pilose at the apex; achenes linear, compressed-angular, black with a pale base, pappus consisting of 3—10 membranous, linear, very unequal apically ciliate scales; receptacle convex or flat, naked or sometimes with short bristles.

Distribution: 80 species in C. and S. America, 1 in N. America, 1 in tropical Africa.

I. Tagetes minuta L., Spec. Pl. (1753) 887; Cabrera, Fl. Buenos Aires, Col. Cient. I.N.T.A. (1963) 250, f. 75.

Herbs, 18—65 cm tall, often much branched, mostly in the upper part, sometimes in the lower part, stem ribbed, glabrous, 1—12 mm thick; internodes 2—8 cm long. Leaves mostly alternate, some opposite, sessile, with a broadened base appressed to the stem, elliptic, pinnatipartite, 3—19 cm long, 1—8.5 cm broad, segments linear-oblong, acute at the top, dentate, glabrous on both sides, with few dark glands at the lower side near the margin, 2—6.5 cm long, 0.3—1 cm broad, lowest segments filiform, often fringed. Heads numerous, in small dense terminal corymbs, 1—5 mm pedunculate;

involucrè narrowly cylindric, 10—12 mm long, 1.5—2.5 mm thick; phyllaries 4, glabrous, with linear oleiferous dark glands. *Marginal flowers* 2 or 3; corolla 2- or 3-lobed at the top (lobes obtuse), 5—6 mm long, tube shortly pilose; achene linear-fusiform, sparsely pilose (hairs appressed), 7—8 mm long, 1—1.5 mm broad, pappus consisting of 2 lanceolate scales (1.5—3 mm long) and 3 much shorter ones. *Disc flowers* 3 or 4; corolla 4—4.5 mm long, tube shortly pilose; achene and pappus like those of marginal flowers; receptacle minute, somewhat convex, naked.

Distribution: tropical America, introduced in S. Europe, Africa, New Guinea, Australia.

NEW GUINEA. East. Central Dist.: Goilala Subdist., between Kuputivava and Omoretu, 1964, Hartley 13038 (L); Isuarana, 1936, Carr 15935 (BM, CANB, L). — E. Highl. Dist.: Goroka Subdist., Finentegu, a few specimens, 1956, Hoogland & Pullen 5272 (BM, LAE); Mt Wilhelm, 1957—1960, Borgmann 283 (L), Brass 30647 (L, NY), Pullen 360 (LAE). — W. Highl. Dist.: near Wabag, Tsark valley, S. of Tel'ia R., 1965, Flenley ANU 2711 (L).

Collectors' annotations: aromatic, malodorous, 1.2—1.5 m tall; corolla of marginal flowers pale yellow, of disc flowers yellow. **Uses:** planted as a rat deterrent.

Ecological notes: weed in gardens, clearings in forest, open places, along streams and tracks; sandy or rocky soil. Altitude: 1080—2650 m.
